Digital Still Camera Image

File Format Standard

(Exchangeable image file format

for Digital Still Cameras: Exif)

Version 2.1

Revision History

This "Digital Still Camera Image File Format Standard" is issued as a standard for the image file format (Exif: Exchangeable image file format) used in digital still cameras and related systems. It was first published in October 1996 as Version 1.0[i]. Then in May 1997, Version 1.1[ii] was issued, adding specifications for optional attribute information as well as stipulations relating to format implementation, in addition to the mandatory specifications of Version 1.0.

The desire for a uniform file format standard for the image data stored by digital still cameras has increased as these cameras have grown in popularity. At the same time, with the broadening application of this technology, a similar desire has arisen for uniformity of the attribute information that can be recorded in a file.

The Version 2.0[iii] makes improvements to the Exif format for greater ease of use, while allowing for backward compatibility with products of manufacturers currently implementing Exif Version 1.x or considering its future implementation. The present Version 2.1 contains Recommended Exif Interoperability Rules.

The following additions and changes are made from Version 1.1 to Version 2.1.

[Additions]

- Audio file format specification
- JPEG compressed thumbnail specification
- Chrominance sampling method Y:Cb:Cr = 4:2:0.
- Tags for FlashPix transformation
- Additional tags for picture-taking conditions
- APP2 marker segment specification for FlashPix extensions
- Definition of color space information
- Addition of Interoperability IFD (Version 2.1)
- Addition of [Appendix D.1 Recommended Exif Interoperability Rules ExifR98] (Version2.1)

[Changes]

- Combined into one chapter the separate chapters on the Exif file specification and implementation specification (Exif-1).
- Removed the limitation on number of pixels (multiples of 8 and 16) to allow for expanded implementation.
- Content of ExifVersion Tag is changed into 2.1

<u>Contents</u>

1. <u>General</u>

1.1. Objectives

This document specifies a standard file format for the image data recorded by digital still cameras (DSC) and related systems, which use a PC Card or other removable memory medium. The aim is to ensure data compatibility and exchangeability, providing a framework in which these products can be used readily by ordinary consumers. In this way it is hoped the standard will contribute to the infrastructure of the information age, as it evolves with the rapid proliferation of personal computers and other information technologies.

1.2. Scope and Abbreviation

This standard applies to the image files recorded on PC Cards and other removable memory by DSC and related systems. The standard is abbreviated as Exif (Exchangeable image file format).

> Note: This standard makes no warranty with respect to the use of "Exif" as a trademark.

1.3. Format Structure

This standard consists of the Exif image file specification and the Exif audio file specification (see Fig. 1). The recording medium specification shall conform to the standard for the particular medium used and is not specified here. Recommendations on implementation are given in Appendix D for directory and file naming.

Exif image file specification	Exif audio file specification
Recording medium specification	
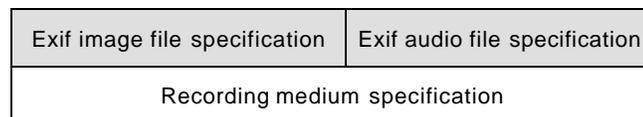

Fig. 1 Format structure

1.4. Exif Image File Specification

The Exif image file specification stipulates the method of recording image data in files, and specifies the following items:

- Structure of image data files,

- Tags used by this standard,

- Definition and management of format versions.

Features of the Exif image file specification include the following.

The file-recording format is based on existing formats. Compressed files are recorded as JPEG (ISO/IEC 10918-1[iv]) with application marker segments (APP1 and APP2) inserted. Uncompressed files are recorded in TIFF Rev. 6.0[v] format. The use of existing formats means files recorded using a DSC or related system can be read directly by commercial applications, and makes possible the use of functions for viewing and manipulating the images.

Related attribute information for both compressed and uncompressed files is stored in the tag information format defined in TIFF Rev. 6.0. Information specific to the camera system and not defined in TIFF is stored in private tags registered for Exif. The Exif image file specification also specifies the method for recording thumbnails. The reason for using the TIFF Rev. 6.0 tag format in the compressed file APP1 segment is to facilitate exchange of attribute data between Exif compressed and uncompressed files.

Compressed files can record extended data exceeding 64 Kbytes by dividing it into multiple APP2 segments. The APP2 segment is used when recording FlashPix[vi] extensions.

A feature of Exif image files is their compatibility with standard formats in wide use today, enabling them to be used on personal computers and other information systems. The intention is to promote widespread use of digital still cameras.

Details of the Exif image file specification are given in Chapter 2 of this document.

1.5. Exif Audio File Specification

The Exif audio file specification stipulates the method of writing audio data in files, and specifies the following items:

- Structure of audio data files,

- Chunks,

- Definition and management of format versions.

Features of the Exif audio file specification include the following.

Files are recorded using the existing RIFF WAVE Form Audio File format.[vii] As data formats, PCM and μ-Law PCM (conforming to ITU-T G.711[viii]) are used for uncompressed audio data, and IMA-ADPCM[ix] for compressed audio data. As with the image files specification, the aim is to enable direct reading, playback and manipulation of the files using the functions in commercial applications.

Related attribute information is stored as an *INFO list* in the case of general attributes, and as Exif-specific chunks in the case of attributes specific to Exif. The Exif-specific chunks are newly provided to enable necessary information to be added by making use of chunk extensibility. The recording of data in an Exif-specific chunk is done in the same way as for an *INFO list*.

Exif audio files, like image files, feature compatibility with standard formats already in wide use, in order to promote the widespread use of digital still cameras.

Details of the Exif audio file specification are given in Chapter 3 of this document.

1.6. Relation between Image and Audio File Specification

This standard includes specifications not only for an image file format but also for an audio file format enabling the recording of audio as a supplementary function.

Also specified in this standard is the relational information indicating the relation between image files and audio files.

Mapping between image files and audio files can be done in various ways; but the Exif standard specifies only the simplest mapping, with others left up to the implementation.

1.7. Presupposed Systems and Compatibility

The image systems presupposed by this standard consist of three elements as follows:

- Equipment: Imaging devices such as cameras, printers and filing equipment,
- Commercial software: Off-the-shelf image processing software running on personal computers,
- Specialized software: Dedicated (system-specific) image processing software running on personal computers.

Image file compatibility on these systems is achieved as follows. The DSC or other system writes data to files in the format specified in this standard. A basic condition of equipment with a playback function is that it be able to read the files it recorded itself. In a personal computer environment, the basic requirement is that dedicated software be able to read all the images, audio and attribute information recorded in conformance with this standard (see Fig. 2).

Fig. 2 Compatibility Concepts
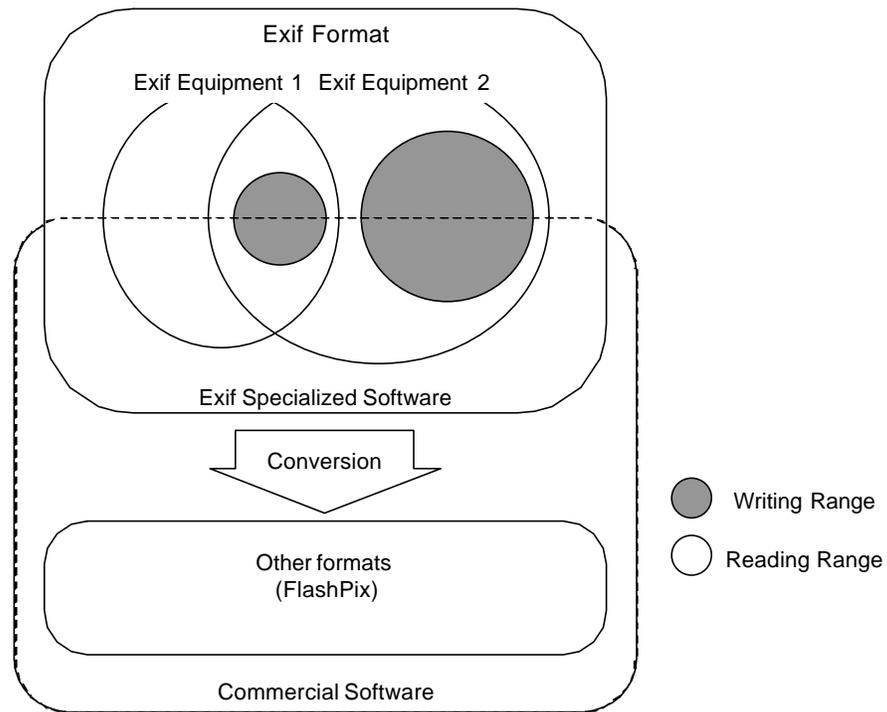

2. Exif Image File Specification

2.1. Outline of the Exif Image File Specification

This chapter gives details of the image file specification, covering the following items:

- Format version definition,
- Specifications relating to image data,
- Basic structure of image data,
- Tags,
- JPEG marker segments,
- Specifications on data recording.

2.2. Format Version

The version of the format specified here is recorded as 4 bytes (see section 2.6.5). The address bytes are recorded as A1, A2, B1, and B2, starting with the lowest number. A1 and A2 store the upper part of the standard version, with the lower part stored in B1 and B2. When changes are made to the version number of this standard, the following rules apply.

- When the changes are such that data readers can properly recognize conventional information and skip the data that was recorded using newly added functions, the lower part of the version (B1, B2) is changed.
- When there is a possibility that a data reader implementing the old standard may operate incorrectly due to the new specifications, the upper part of the version (A1, A2) is changed.

Players should be able to play back files of versions earlier than the supported standard.

2.3. Definition of Glossary

Terms and notation are used as follows in this standard:

- "Tag" is used as a synonym of "field",
- ".H" appended to a numerical value means it is hexadecimal notation,
- Unless otherwise indicated, other numerical values are given in decimal notation,

- The initial IFD in a file is the "0th IFD," with the next IFD being called the 1st IFD,

- The original image is called the "primary image," and small images used to index the primary images are called "thumbnail" images,

- Data referred to in the JPEG standard as "Interoperability coded data" is here called "compressed data".

2.4. Specifications Relating to Image Data

2.4.1. Number of Pixels

There is no limit on number of pixels of the primary image when it is recorded as either uncompressed or JPEG compressed data. Note that when recording as JPEG compressed data images for which the number of lines (*ImageLength*) or number of samples/line (*ImageWidth*) is not a multiple of 8 or 16, the method of recording is as stipulated in section 2.8.1. The above specification applies similarly to thumbnails.

2.4.2. Pixel Aspect

Image data is recorded as square pixels with a pixel aspect ratio of 1:1. This specification is applied similarly to thumbnails.

2.4.3. Pixel Composition and Sampling

The combination of pixel composition and pixel sampling for image data must be RGB 4:4:4 and either Y:Cb:Cr = 4:2:2 or Y:Cb:Cr = 4:2:0. The pixel composition of image data must also be 8 bits each. This specification is applied similarly to thumbnails.

As sampling points on the elements making up pixels, the Y and Cb,Cr sampling points may be either co-sited or centered. Fig. 3 shows typical pixel sampling for image width w and height h. In the case of Y:Cb:Cr = 4:2:2, spatial co-siting is recommended for the sake of improved image quality on TV systems. For Y:Cb:Cr = 4:2:0, spatial centering is recommended as per the TIFF default and is most common format of the personal computer applications.
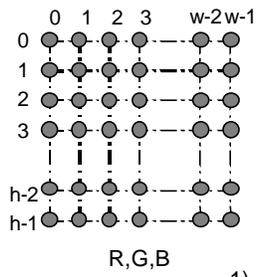

1) RGB 4:4:4
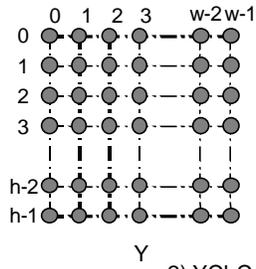

2) YCbCr 4:2:2 (Co-sited)
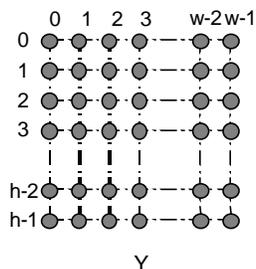

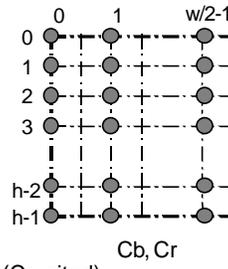

3) YCbCr 4:2:2 (Centered)
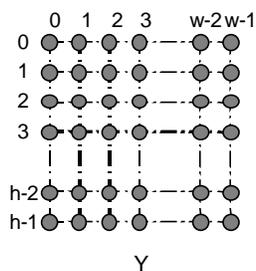

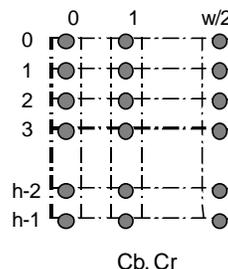

4) YCbCr 4:2:0 (Co-sited)
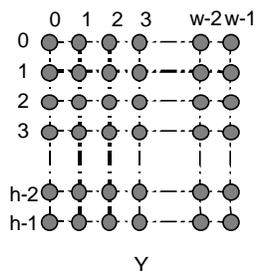

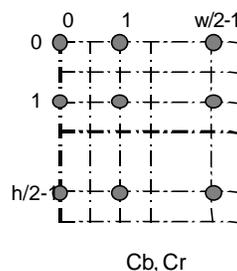

5) YCbCr 4:2:0 (Centered)
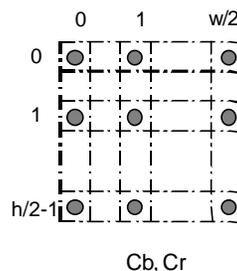

Fig. 3 Pixel Composition and Pixel Sampling

2.4.4. Image Data Arrangement

Image data must be arranged as follows. Uncompressed data shall consist of pixels with each line traced from left to right, and one screen shall consist of lines traced from top to bottom. JPEG compressed data shall consist of blocks configured of pixels traced in similar sequence. Fig. 4 shows the various data arrangements for recording in files images with pixels of width w and height h

R[0,0]	G[0,0]	B[0,0]	R[1,0]	G[1,0]	B[1,0]	....
....

6) Compressed JPEG Block-Interleave (4:2:0)

Fig. 4   Data Arrangement

2.5. Basic Structure of Image Data

2.5.1. Basic Structure of Primary Image Data

Image data employs following existing image formats, depending on the image data type:

- RGB uncompressed data: Baseline TIFF Rev. 6.0 RGB Full Color Images [v],

- YCbCr uncompressed data: TIFF Rev. 6.0 Extensions YCbCr Images [v],

- JPEG compressed data: JPEG Baseline ADCT [iv].

For compressed data, the attribute information required by the DSC application shall be recorded in APP1. Data writing in APP1 shall be compatible with TIFF. The use of a common method of storing attribute information for both compressed and uncompressed data results in a simpler format, while the ability to add private tags for additional information takes advantage of the extensibility of the tag mechanism.

2.5.2. Basic Structure of Uncompressed RGB Data

Uncompressed RGB data is recorded in conformance with Baseline TIFF Rev. 6.0 RGB Full Color Images [v].

Attribute information is recorded in tags specified in TIFF Rev. 6.0. Attribute information specific to Exif is recorded using private tags reserved in TIFF for this standard. The private tags point to sets of this attribute information (Exif IFD).

Files are structured as follows (see Fig. 5). As in the TIFF standard, the recording location of each IFD value is not specified:

- File Header,

- 0th IFD,

- 0th IFD Value,

- 1st IFD,

- 1st IFD Value,

- 1st (Thumbnail) Image Data,

- 0th (Primary) Image Data.
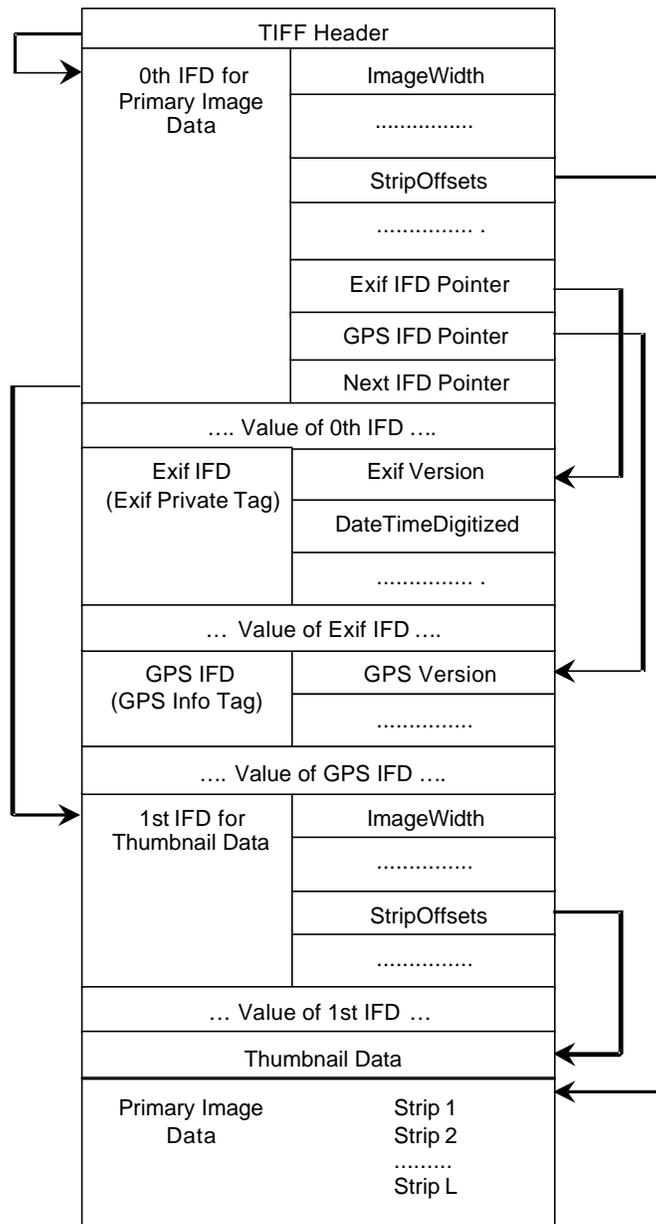

Fig. 5 Basic Structure of Uncompressed Data Files

File Headers are 8 bytes as defined in the TIFF standard, with the Offset of IFD indicating the start address of the 0th IFD (see Table 1).

The 0th IFD Offset of Next IFD indicates the start address of the 1st IFD (thumbnail images). When the 1st IFD is not recorded, the 0th IFD Offset of Next IFD terminates with 00000000.H.

On the IFD description method see section 2.6.2.

Table 1 TIFF Headers

Name	Size (Bytes)	Value
Byte Order	2	Written as either "II" (4949.H) (little endian) or "MM" (4D4D.H) (big endian) depending on the CPU of the machine doing the recording.
42	2	002A.H (fixed)
Offset of IFD	4	0th IFD offset. If the TIFF header is followed immediately by the 0th IFD, it is written as 00000008.H.

2.5.3. Basic Structure of YCbCr Uncompressed Data

YCbCr uncompressed data is recorded in conformance with TIFF Rev. 6.0 Extensions YCbCr Images[v].   Tags for the following information are available for YCbCr uncompressed data in addition to the attribute information for RGB uncompressed data;

- RGB-YCbCr color transformation matrix coefficients (*YCbCrCoefficients*),

- Chrominance subsampling information (*YCbCrSubSampling*),

- Information on matching/nonmatching of chrominance and luminance samples (*YCbCrPositioning*).

The method of recording other attribute information is the same as for uncompressed RGB data (see section 2.5.2).

2.5.4. Basic Structure of JPEG Compressed Data

Compressed data files are recorded in conformance with the JPEG DCT format specified in ISO/IEC 10918-1,[iv] with the Application Market Segment (APP1) inserted. APP1 is recorded immediately after the SOI marker indicating the beginning of the file (see Fig. 6). Multiple APP2 can be recorded as necessary, starting immediately after APP1. APPn other than APP1 and APP2 or COM segments are not used by Exif. However Exif readers should be designed skip over unknown APPn and COM.

Structure of Compressed file

SOI	Start of Image
APP1	Application Marker Segment 1 (Exif Attribute Information)
(APP2)	(Application Marker Segment 2) (FlashPix Extension data)
DQT	Quantization Table
DHT	Huffman Table
(DRI)	(Restart Interval)
SOF	Frame Header
SOS	Scan Header
	Compressed Data
EOI	End of Image

Structure of APP1

APP1 Marker
APP1 Length
Exif Identifier Code
TIFF Header
0th IFD
0th IFD Value
1st IFD
1st IFD Value
1st IFD Image Data
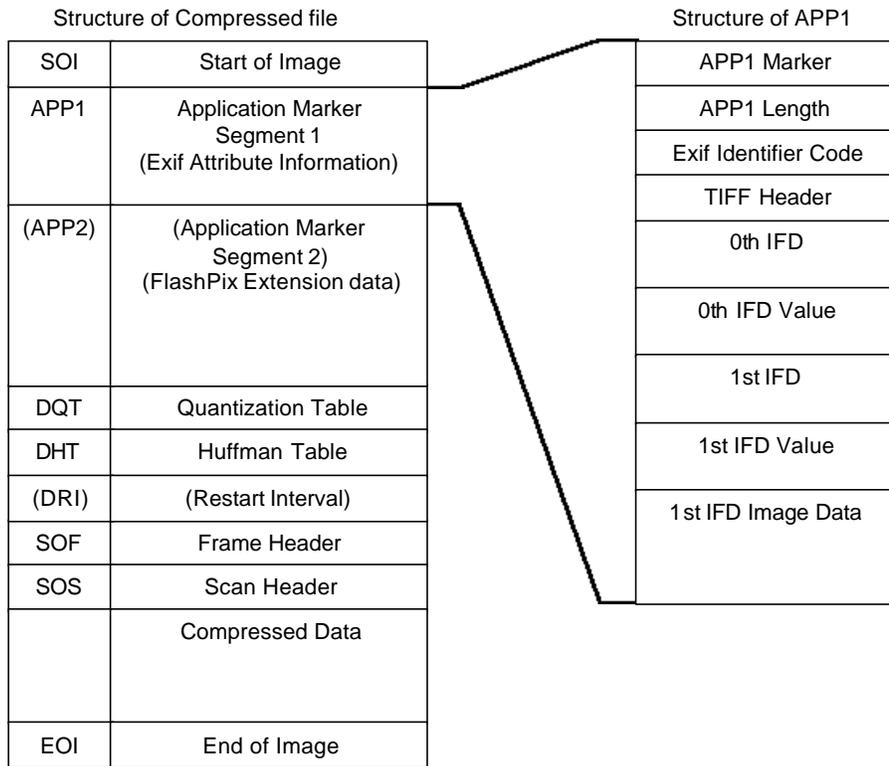

Fig. 6 Basic Structure of Compressed Data Files

Interoperability, APP1 consists of the APP1 marker, Exif identifier code, and the attribute information itself. The size of APP1 including all these elements must not exceed the 64 Kbytes specified in the JPEG standard.

Attribute information is stored in TIFF structure including a File Header, with a maximum of two IFD (0th IFD, 1st IFD). The 0th IFD records attribute information concerning the compressed image (primary image). The 1st IFD can be used to record a thumbnail image. For details see section 2.7.2.

APP2 consists of the APP2 marker, FPXR (FlashPix Ready) identifier code, and contents list for FlashPix extension recording, or stream data. A string of multiple APP2 marker segments can be used to record data exceeding 64 Kbytes. For details see section 2.7.3.

2.5.5. Basic Structure of Thumbnail Data

Thumbnail data is recorded in the 1st IFD similarly to primary images, using two existing image formats.

No limit is placed on the size of thumbnail images. Thumbnails are not mandatory, but it is recommended that they be recorded if possible, unless hardware or other restrictions preclude this.

Thumbnail data does not necessarily have to adopt the same data structure as that used for primary images. If, however, the primary images are recorded as uncompressed RGB data or as uncompressed YCbCr data, thumbnail images cannot be recorded as JPEG compressed data (see Table 2).

Table 2 Combinations of primary image and thumbnail data structures

		Primary Image	
		Uncompressed	Compressed
Thumbnail	Uncompressed	Possible	Possible
	Compressed	Not possible	Possible

When thumbnails are recorded in uncompressed format, they are to be recorded in the 1st IFD in conformance with Baseline TIFF Rev. 6.0 RGB Full Color Images or TIFF Rev. 6.0 Extensions YCbCr Images.

An Exif-specific recording method is used to record compressed thumbnails.

In this case the *Compression* tag value is set to "6" and tags in the 1st IFD (*JPEGInterchangeFormat*, *JPEGInterchangeFormatLength*) are used to designate the location and size. The images are recorded at the designated location as a JPEG stream (from SOI to EOI) conforming to the JPEG Baseline DCT format. No APPn marker, COM marker, nor restart marker is recorded in the JPEG stream (see Fig. 7). To avoid duplicate definitions, the 1st IFD is not used to record a tag indicating a TIFF image or information recorded elsewhere as a JPEG marker segment.

Exif Compressed File	APP1 Marker	Compressed Thumbnail
SOI	APP1 Marker	SOI
APP1	Length	DQT
	Exif	DHT
DQT	TIFF Header	SOF
DHT	0th IFD	SOS
SOF		Compressed Data
SOS	Exif IFD	
Compressed Data	1st IFD JPEGInterchangeFormat JPEGInterchangeFormatLength	
	JPEG Thumbnail	
EOI		EOI
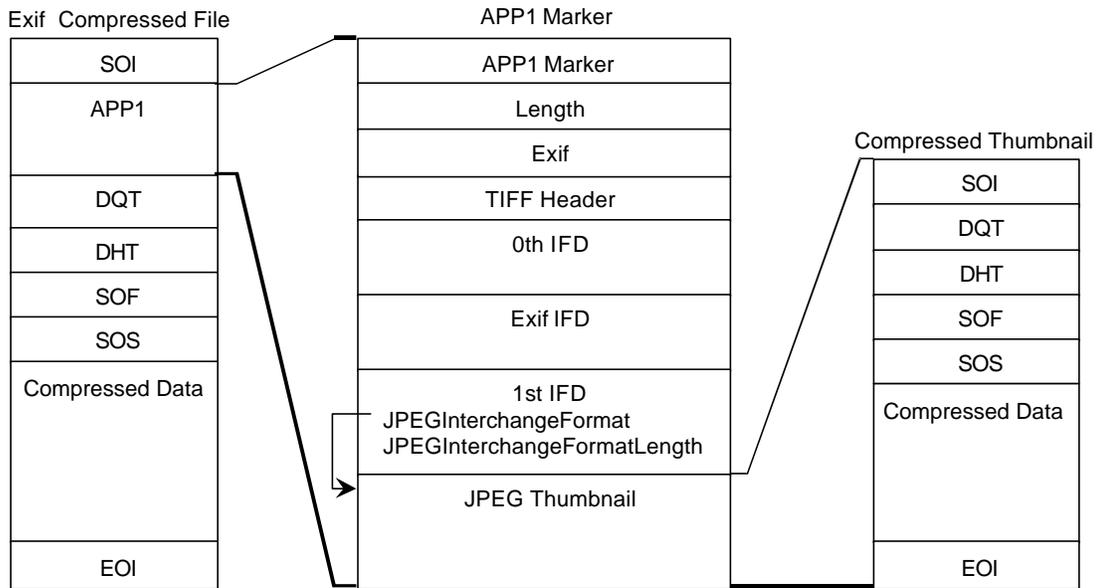

Fig. 7 Structure of Exif file with compressed thumbnail

2.6. Tags

2.6.1. Features of Attribute Information

RGB data conforms to Baseline TIFF Rev. 6.0 RGB Full Color Images, and YCbCr data to TIFF Rev. 6.0 Extensions YCbCr Images. Accordingly, the parts that follow the TIFF structure must be recorded in conformance to the TIFF standard. In addition to the attribute information indicated as mandatory in the TIFF standard, this Exif standard adds the TIFF optional tags that can be used in a DSC or other system, Exif-specific tags for recording DSC-specific attribute information, and GPS tags for recording position information. There are also Exif-original specifications not found in the TIFF standard for compressed recording of thumbnails.

Recording of compressed data differs from uncompressed data in the following respects:

- When the primary image data is recorded in compressed form, there is no tag indicating the primary image itself or its address (pointer),

- When thumbnail data is recorded in compressed form, address and size are designated using Exif-specific tags,

- Tags that duplicate information given in the JPEG Baseline are not recorded (for either primary images or thumbnails).

- Information relating to compression can be recorded using the tags for this purpose.

2.6.2. IFD Structure

The IFD used in this standard consists of a 2-byte count (number of fields), 12-byte field Interoperability arrays, and 4-byte offset to the next IFD, in conformance with TIFF Rev. 6.0.

Each of the 12-byte field Interoperability consists of the following four elements respectively.

Bytes 0-1   Tag
Bytes 2-3   Type
Bytes 4-7   Count
Bytes 8-11   Value Offset

Each element is explained briefly below. For details see TIFF Rev. 6.0.

Tag

Each tag is assigned a unique 2-byte number to identify the field. The tag numbers in the Exif 0th IFD and 1st IFD are all the same as the TIFF tag numbers.

Type

The following types are used in Exif:

1 = BYTE	An 8-bit unsigned integer.,	
2 = ASCII	An 8-bit byte containing one 7-bit ASCII code. The final byte is terminated with NULL.,	
3 = SHORT	A 16-bit (2-byte) unsigned integer,	
4 = LONG	A 32-bit (4-byte) unsigned integer,	
5 = RATIONAL	Two LONGs. The first LONG is the numerator and the second LONG expresses the denominator.,	
7 = UNDEFINED	An 8-bit byte that can take any value depending on the field definition,	
9 = SLONG	A 32-bit (4-byte) signed integer (2's complement notation),	
10 = SRATIONAL	Two SLONGs. The first SLONG is the numerator and the second SLONG is the denominator.	

Count

The number of values. It should be noted carefully that the count is not the sum of the bytes. In the case of one value of SHORT (16 bits), for example, the count is '1' even though it is 2 bytes.

Value Offset

This tag records the offset from the start of the TIFF header to the position where the value itself is recorded. In cases where the value fits in 4 bytes, the value itself is recorded. If the value is smaller than 4 bytes, the value is stored in the 4-byte area starting from the left, i.e., from the lower end of the byte offset area. For example, in big endian format, if the type is SHORT and the value is 1, it is recorded as 00010000.H.

Note that field Interoperability must be recorded in sequence starting from the smallest tag number. There is no stipulation regarding the order or position of tag value (Value) recording.

2.6.3. Exif-specific IFD

A. Exif IFD

Exif IFD is a set of tags for recording Exif-specific attribute information. It is pointed to by the offset from the TIFF header (Value Offset) indicated by an Exif private tag value.

Exif IFD Pointer

```
Tag      = 34665 (8769.H)
Type     = LONG
Count    = 1
Default  = none
```

A pointer to the Exif IFD. Interoperability, Exif IFD has the same structure as that of the IFD specified in TIFF. Ordinarily, however, it does not contain image data as in the case of TIFF.

B. GPS IFD

GPS IFD is a set of tags for recording GPS information It is pointed to by the offset from the TIFF header (Value Offset) indicated by a GPS private tag value.

GPS Info IFD Pointer

```
Tag      = 34853 (8825.H)
Type     = LONG
Count    = 1
Default  = none
```

A pointer to the GPS Info IFD. The Interoperability structure of the GPS Info IFD, like that of Exif IFD, has no image data.

C. Interoperability IFD

Interoperability IFD is composed of tags which stores the information to ensure the Interoperability and pointed by the following tag located in Exif IFD.

Interoperability IFD Pointer

```
Tag      = 40965  A005.H
Type     = LONG
Count    = 1
Default  = None
```

The Interoperability structure of Interoperability IFD is same as TIFF defined IFD structure but does not contain the

image data characteristically compared with normal TIFF IFD.

2.6.4. TIFF Rev. 6.0 Attribute Information

Table 3 lists the attribute information used in Exif, including the attributes given as mandatory in Baseline TIFF Rev. 6.0 RGB Full Color Images and TIFF Rev. 6.0 Extensions YCbCr Images, as well as the optional TIFF tags used by DSC and other systems. The contents are explained below.

Table 3   TIFF Rev. 6.0 Attribute Information Used in Exif

Tag Name	Field Name	Tag ID Dec	Tag ID Hex	Type	Count
A. Tags relating to image data structure					
Image width	ImageWidth	256	100	SHORT or LONG	1
Image height	ImageLength	257	101	SHORT or LONG	1
Number of bits per component	BitsPerSample	258	102	SHORT	3
Compression scheme	Compression	259	103	SHORT	1
Pixel composition	PhotometricInterpretation	262	106	SHORT	1
Orientation of image	Orientation	274	112	SHORT	1

*S   Chunky format: StripsPerImage

Planar format: SamplesPerImage * StripsPerImage

StripsPerImage = floor((ImageLength + RowsPerStrip -1)/ RowsPerStrip)

A. Tags relating to image data structure

ImageWidth

The number of columns of image data, equal to the number of pixels per row. In JPEG compressed data a JPEG marker is used instead of this tag.

Tag   = 256 (100.H)

Type   = SHORT or LONG

Count   = 1

Default = none

ImageLength

The number of rows of image data. In JPEG compressed data a JPEG marker is used instead of this tag.

Tag   = 257 (101.H)

Type   = SHORT or LONG

Count   = 1

Default = none

BitsPerSample

The number of bits per image component. In this standard each component of the image is 8 bits, so the value for this tag is 8. See also *SamplesPerPixel*. In JPEG compressed data a JPEG marker is used instead of this tag.

Tag   = 258 (102.H)

Type   = SHORT

Count   = 3

Default = 8   8   8

Compression

The compression scheme used for the image data. When a primary image is JPEG compressed, this designation is not necessary and is omitted. When thumbnails use JPEG compression, this tag value is set to 6.

Tag   = 259 (103.H)

Type   = SHORT

Count   = 1

Default = none

   1   = uncompressed

   6   = JPEG compression (thumbnails only)

   Other   = reserved

PhotometricInterpretation

The pixel composition. In JPEG compressed data a JPEG marker is used instead of this tag.

Tag   =   262 (106.H)

Type   =   SHORT

Count   =   1

Default =   none

2   =   RGB

6   =   YCbCr

Other   =   reserved

Orientation

The image orientation viewed in terms of rows and columns.

Tag   =   274 (112.H)

Type   =   SHORT

Count   =   1

Default =   1

1   =   The 0th row is at the visual top of the image, and the 0th column is the visual left-hand side.

2   =   The 0th row is at the visual top of the image, and the 0th column is the visual right-hand side.

3   =   The 0th row is at the visual bottom of the image, and the 0th column is the visual right-hand side.

4   =   The 0th row is at the visual bottom of the image, and the 0th column is the visual left-hand side.

5   =   The 0th row is the visual left-hand side of of the image, and the 0th column is the visual top.

6   =   The 0th row is the visual right-hand side of of the image, and the 0th column is the visual top.

7   =   The 0th row is the visual right-hand side of of the image, and the 0th column is the visual bottom.

8   =   The 0th row is the visual left-hand side of of the image, and the 0th column is the visual bottom.

Other   =   reserved

SamplesPerPixel

The number of components per pixel. Since this standard applies to RGB and YCbCr images, the value set for this tag is 3. In JPEG compressed data a JPEG marker is used instead of this tag.

Tag   =   277 (115.H)

Type   =   SHORT

Count   =   1

Default =   3

PlanarConfiguration

Indicates whether pixel components are recorded in chunky or planar format. In JPEG compressed files a JPEG marker is used instead of this tag. If this field does not exist, the TIFF default of 1 (chunky) is assumed.

Tag	=	284 (11C.H)
Type	=	SHORT
Count	=	1
1	=	chunky format
2	=	planar format
Other	=	reserved

YCbCrSubSampling

The sampling ratio of chrominance components in relation to the luminance component. In JPEG compressed data a JPEG marker is used instead of this tag.

Tag	=	530 (212.H)
Type	=	SHORT
Count	=	2
[2, 1]	=	YCbCr4:2:2
[2, 2]	=	YCbCr4:2:0
Other	=	reserved

YCbCrPositioning

The position of chrominance components in relation to the luminance component. This field is designated only for JPEG compressed data or uncompressed YCbCr data. The TIFF default is 1 (centered); but when Y:Cb:Cr = 4:2:2 it is recommended in this standard that 2 (co-sited) be used to record data, in order to improve the image quality when viewed on TV systems. When this field does not exist, the reader shall assume the TIFF default. In the case of Y:Cb:Cr = 4:2:0, the TIFF default (centered) is recommended. If the reader does not have the capability of supporting both kinds of *YCbCrPositioning*, it shall follow the TIFF default regardless of the value in this field. It is preferable that readers be able to support both centered and co-sited positioning.

Tag	=	531 (213.H)
Type	=	SHORT
Count	=	1
Default	=	1
1	=	centered
2	=	co-sited
Other	=	reserved

YCbCrPositioning = 1　　　　　　　　YCbCrPositioning = 2
(centered)　　　　　　　　　　　　　(co-sited)

a) Y:Cb:Cr = 4:2:2

YCbCrPositioning = 1　　　　　　　　YCbCrPositioning = 2
(centered)　　　　　　　　　　　　　(co-sited)

b) Y:Cb:Cr = 4:2:0

✕　Luminance Sample
◯　Chrominance Sample
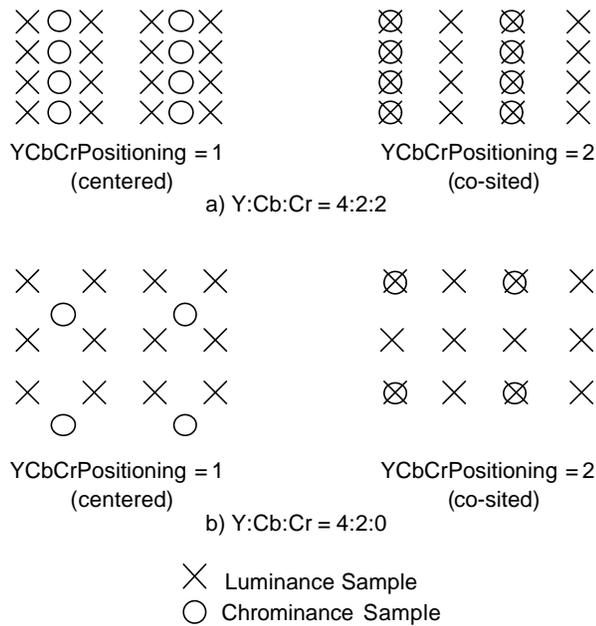

Fig. 8　YCbCrPositioning

XResolution

The number of pixels per *ResolutionUnit* in the *ImageWidth* direction. When the image resolution is unknown, 72 [dpi] is designated.

Tag　　　=　282 (11A.H)

Type　　=　RATIONAL

Count　　=　1

Default　=　72

YResolution

The number of pixels per *ResolutionUnit* in the *ImageLength* direction. The same value as *XResolution* is designated.

Tag　　　=　283 (11B.H)

Type　　=　RATIONAL

Count　　=　1

Default　=　72

ResolutionUnit

The unit for measuring *XResolution* and *YResolution*. The same unit is used for both *XResolution* and *YResolution*. If the image resolution in unknown, 2 (inches) is designated.

Tag　　　=　296 (128.H)

Type   =   SHORT

Count   =   1

Default   =   2

    2   =   inches

    3   =   centimeters

    Other   =   reserved

B. Tags relating to recording offset

StripOffsets

For each strip, the byte offset of that strip. It is recommended that this be selected so the number of strip bytes does not exceed 64 Kbytes. With JPEG compressed data this designation is not needed and is omitted. See also *RowsPerStrip* and *StripByteCounts*.

Tag   =   273 (111.H)

Type   =   SHORT or LONG

Count   =   StripsPerImage   (when PlanarConfiguration = 1)

          =   SamplesPerPixel * StripsPerImage(when PlanarConfiguration = 2)

Default   =   none

RowsPerStrip

The number of rows per strip. This is the number of rows in the image of one strip when an image is divided into strips. With JPEG compressed data this designation is not needed and is omitted. See also *RowsPerStrip* and *StripByteCounts*.

Tag

Tag   =   278 (116.H)

Type   =   SHORT or LONG

Count   =   1

Default   =   none

StripByteCounts

The total number of bytes in each strip. With JPEG compressed data this designation is not needed and is omitted.

Tag   =   279 (117.H)

Type   =   SHORT or LONG

Count   =   StripsPerImage   (when PlanarConfiguration = 1)

              SamplesPerPixel * StripsPerImage(when PlanarConfiguration = 2)

Default   =   none

JPEGInterchangeFormat

The offset to the start byte (SOI) of JPEG compressed thumbnail data. This is not used for primary image JPEG data.

Tag   =   513 (201.H)

Type   =   LONG

Default   =   none

JPEGInterchangeFormatLength

The number of bytes of JPEG compressed thumbnail data. This is not used for primary image JPEG data. JPEG thumbnails are not divided but are recorded as a continuous JPEG bitstream from SOI to EOI. APPn and COM markers should not be recorded. Compressed thumbnails must be recorded in no more than 64 Kbytes, including all other data to be recorded in APP1.

    Tag   = 514 (202.H)
    Type   = LONG
    Default = none

C. Tags Relating to Image Data Characteristics

TransferFunction

A transfer function for the image, described in tabular style. Normally this tag is not necessary, since color space is specified in the color space information tag (*ColorSpace*).

    Tag   =   301 (12D.H)

    Type   =   SHORT

    Count   =   3 * 256

    Default =   none

WhitePoint

The chromaticity of the white point of the image. Normally this tag is not necessary, since color space is specified in the color space information tag (*ColorSpace*).

    Tag   =   318 (13E.H)

    Type   =   RATIONAL

    Count   =   2

    Default =   none

PrimaryChromaticities

The chromaticity of the three primary colors of the image. Normally this tag is not necessary, since color space is specified in the color space information tag (*ColorSpace*).

    Tag   =   319 (13F.H)

    Type   =   RATIONAL

    Count   =   6

    Default =   none

YCbCrCoefficients

The matrix coefficients for transformation from RGB to YCbCr image data. No default is given in TIFF; but here the value given in Appendix E, "Color Space Guidelines," is used as the default. The color space is declared in a color space information tag, with the default being the value that gives the optimal image characteristics Interoperability this condition.

    Tag   =   529 (211.H)

    Type   =   RATIONAL

    Count   =   3

    Default =   See Appendix E.

ReferenceBlackWhite

The reference black point value and reference white point value. No defaults are given in TIFF, but the values below are given as defaults here. The color space is declared in a color space information tag, with the default being the value that gives the optimal image characteristics Interoperability these conditions.

Tag = 532 (214.H)

Type = RATIONAL

Count = 6

Default = [0, 255, 0, 255, 0, 255]   (when PhotometricInterpretation is RGB)

[0, 255, 0, 128, 0, 128]   (when PhotometricInterpretation is YCbCr)

D. Other Tags

DateTime

The date and time of image creation. In this standard it is the date and time the file was changed. The format is "YYYY:MM:DD HH:MM:SS" with time shown in 24-hour format, and the date and time separated by one blank character [20.H]. When the date and time are unknown, all the character spaces except colons (":") may be filled with blank characters, or else the Interoperability field may be filled with blank characters. The character string length is 20 bytes including NULL for termination. When the field is left blank, it is treated as unknown.

```
Tag      =   306 (132.H)
Type     =   ASCII
Count    =   20
Default  =   none
```

ImageDescription

A character string giving the title of the image. It may be a comment such as "1988 company picnic" or the like. Two-byte character codes cannot be used. When a 2-byte code is necessary, the Exif Private tag *UserComment* is to be used.

```
Tag      =   270 (10E.H)
Type     =   ASCII

Count    =   Any
Default  =   none
```

Make

The manufacturer of the recording equipment. This is the manufacturer of the DSC, scanner, video digitizer or other equipment that generated the image. When the field is left blank, it is treated as unknown.

```
Tag      =   271 (10F.H)
Type     =   ASCII
Count    =   Any
Default  =   none
```

Model

The model name or model number of the equipment. This is the model name of number of the DSC, scanner, video digitizer or other equipment that generated the image. When the field is left blank, it is treated as unknown.

```
Tag      =   272 (110.H)
Type     =   ASCII
```

```
Count    =  Any
Default  =  none
```

Software

This tag records the name and version of the software or firmware of the camera or image input device used to generate the image. The detailed format is not specified, but it is recommended that the example shown below be followed. When the field is left blank, it is treated as unknown.

Ex.) "Exif Software Version 1.00a"

```
Tag      =  305 (131h)
Type     =  ASCII
Count    =  Any
Default  =  none
```

Artist

This tag records the name of the camera owner, photographer or image creator. The detailed format is not specified, but it is recommended that the information be written as in the example below for ease of Interoperability. When the field is left blank, it is treated as unknown.

Ex.) "Camera owner, John Smith; Photographer, Michael Brown; Image creator, Ken James"

```
Tag      =  315 (13Bh)
Type     =  ASCII
Count    =  Any
Default  =  none
```

Copyright

Copyright information In this standard the tag is used to indicate both the photographer and editor copyrights. It is the copyright notice of the person or organization claiming rights to the image. The Interoperability copyright statement including date and rights should be written in this field; e.g., "Copyright, John Smith, 19xx. All rights reserved." In this standard the field records both the photographer and editor copyrights, with each recorded in a separate part of the statement. When there is a clear distinction between the photographer and editor copyrights, these are to be written in the order of photographer followed by editor copyright, separated by NULL (in this case, since the statement also ends with a NULL, there are two NULL codes) (see example 1). When only the photographer copyright is given, it is terminated by one NULL code (see example 2). When only the editor copyright is given, the photographer copyright part consists of one space followed by a terminating NULL code, then the editor copyright is given (see example 3). When the field is left blank, it is treated as unknown.

Ex. 1) When both the photographer copyright and editor copyright are given.

Photographer copyright + NULL[00.H] + editor copyright + NULL[00.H]

Ex. 2) When only the photographer copyright is given.

Photographer copyright + NULL[00.H]

Ex. 3) When only the editor copyright is given.

Space[20.H]+ NULL[00.H] + editor copyright + NULL[00.H]

Tag = 33432 (8298.H)

Type = ASCII

Count = Any

Default = none

2.6.5. Exif IFD Attribute Information

The attribute information (field names and codes) recorded in the Exif IFD is given in Table 4 and Table 5 followed by an explanation of the contents.

Table 4 Exif IFD Attribute Information (1)

Tag Name	Field Name	Tag ID Dec	Tag ID Hex	Type	Count
A. Tags Relating to Version					
Exif version	ExifVersion	36864	9000	UNDEFINED	4

A. Tags Relating to Version

ExifVersion

The version of this standard supported. Nonexistence of this field is taken to mean nonconformance to the standard (see section 2.2). Conformance to this standard is indicated by recording "0210" as 4-byte ASCII. Since the type is UNDEFINED, there is no NULL for termination.

    Tag   =   36864 (9000.H)
    Type   =   UNDEFINED
    Count   =   4
    Default =   "0210"

FlashPixVersion

The FlashPix format version supported by a FPXR file. If the FPXR function supports FlashPix format Ver. 1.0, this is indicated similarly to *ExifVersion* by recording "0100" as 4-byte ASCII. Since the type is UNDEFINED, there is no NULL for termination.

    Tag   =   40960(A000.H)
    Type   =   UNDEFINED
    Count   =   4
    Default =   "0100"
        0100   =   FlashPix Format Version 1.0
        Other   =   reserved

B. Tag Relating to Color Space

ColorSpace

The color space information tag (*ColorSpace*) is always recorded as the color space specifier.

Normally sRGB (=1) is used to define the color space based on the PC monitor conditions and environment. If a color space other than sRGB is used, Uncalibrated (=FFFF.H) is set. Image data recorded as Uncalibrated can be treated as sRGB when it is converted to FlashPix. On sRGB see Appendix E.

```
Tag       = 40961 (A001.H)
Type      = SHORT
Count     = 1
    1         =  sRGB
   FFFF.H  =  Uncalibrated
   Other    =  reserved
```

.

C. Tags Relating to Image Configuration

PixelXDimension

Information specific to compressed data. When a compressed file is recorded, the valid width of the meaningful image must be recorded in this tag, whether or not there is padding data or a restart marker. This tag should not exist in an uncompressed file. For details see section 2.8.1 and Appendix F.

    Tag   = 40962 (A002.H)

    Type   = SHORT or LONG

    Count   = 1

    Default = none

PixelYDimension

Information specific to compressed data. When a compressed file is recorded, the valid height of the meaningful image must be recorded in this tag, whether or not there is padding data or a restart marker. This tag should not exist in an uncompressed file. For details see section 2.8.1 and Appendix F. Since data padding is unnecessary in the vertical direction, the number of lines recorded in this valid image height tag will in fact be the same as that recorded in the SOF.

    Tag   = 40963 (A003.H)

    Type   = SHORT of LONG

    Count   = 1

ComponentsConfiguration

Information specific to compressed data. The channels of each component are arranged in order from the 1st component to the 4th. For uncompressed data the data arrangement is given in the *PhotometricInterpretation* tag. However, since *PhotometricInterpretation* can only express the order of Y,Cb and Cr, this tag is provided for cases when compressed data uses components other than Y, Cb, and Cr and to enable support of other sequences.

    Tag   = 37121 (9101.H)

    Type   = UNDEFINED

    Count   = 4

    Default = 4 5 6 0 (if RGB uncompressed)

                1 2 3 0 (other cases)

        0   = does not exist

        1   = Y

        2   = Cb

        3   = Cr

        4   = R

        5   = G

```
6        =  B
Other    =  reserved
```

CompressedBitsPerPixel

Information specific to compressed data. The compression mode used for a compressed image is indicated in unit bits per pixel.

```
Tag      =  37122 (9102.H)
Type     =  RATIONAL
Count    =  1
Default  =  none
```

D. Tags Relating to User Information

MakerNote

A tag for manufacturers of Exif writers to record any desired information. The contents are up to the manufacturer.

    Tag   =   37500 (927C.H)

    Type   =   UNDEFINED

    Count   =   Any

    Default =   none

UserComment

A tag for Exif users to write keywords or comments on the image besides those in *ImageDescription*, and without the character code limitations of the *ImageDescription* tag.

    Tag   =   37510 (9286.H)

    Type   =   UNDEFINED

    Count   =   Any

    Default =   none

The character code used in the *UserComment* tag is identified based on an ID code in a fixed 8-byte area at the start of the tag data area. The unused portion of the area is padded with NULL ("00.H"). ID codes are assigned by means of registration. The designation method and references for each character code are given in Table 6 . The value of Count N is determined based on the 8 bytes in the character code area and the number of bytes in the user comment part. Since the TYPE is not ASCII, NULL termination is not necessary (see Fig. 9).

Table 6 Character Codes and their Designation

Character Code	Code Designation (8 Bytes)	References
ASCII	41.H, 53.H, 43.H, 49.H, 49.H, 00.H, 00.H, 00.H	ITU-T T.50 IA5 [x]
JIS	4A.H, 49.H, 53.H, 00.H, 00.H, 00.H, 00.H, 00.H	JIS X0208-1990 [xi]
Unicode	55.H, 4E.H, 49.H, 43.H, 4F.H, 44.H, 45.H, 00.H	Unicode Standard [xii]
Undefined	00.H, 00.H, 00.H, 00.H, 00.H, 00.H, 00.H, 00.H	Undefined
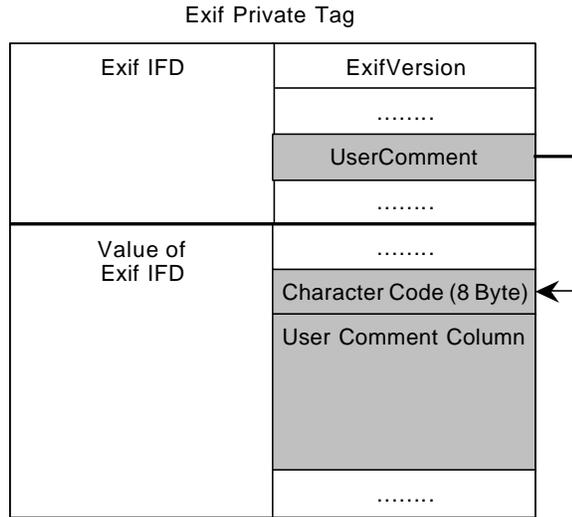

Fig. 9   User Comment Tag

The ID code for the *UserComment* area may be a Defined code such as JIS or ASCII, or may be Undefined. The Undefined name is *UndefinedText*, and the ID code is filled with 8 bytes of all "NULL" ("00.H"). An Exif reader that reads the *UserComment* tag must have a function for determining the ID code. This function is not required in Exif readers that do not use the   *UserComment*   tag (see Table 7).

Table 7   Implementation of Defined and Undefined Character Codes

ID Code	Exif Reader Implementation
Defined (JIS, ASCII, etc.)	Determines the ID code and displays it in accord with the reader capability.
Undefined (all NULL)	Depends on the localized PC in each country. (If a character code is used for which there is no clear specification like Shift-JIS in Japan, Undefined is used.) Although the possibility of unreadable characters exists, display of these characters is left as a matter of reader implementation.

When a *UserComment* area is set aside, it is recommended that the ID code be ASCII and that the following user comment part be filled with blank characters [20.H].

E. Tag Relating to Related File

RelatedSoundFile

This tag is used to record the name of an audio file related to the image data. The only relational information recorded here is the Exif audio file name and extension (an ASCII string consisting of 8 characters + '.' + 3 characters). The path is not recorded. Stipulations on audio are given in section 3.6.3. File naming conventions are given in section 3.7.1.

When using this tag, audio files must be recorded in conformance to the Exif audio format. Writers are also allowed to store the data such as Audio within APP2 as FlashPix extension stream data.

Audio files must be recorded in conformance to the Exif audio format.

The mapping of Exif image files and audio files is done in any of the three ways shown in Table 8. If multiple files are mapped to one file as in [2] or [3] of this table, the above format is used to record just one audio file name. If there are multiple audio files, the first recorded file is given.

In the case of [3] in Table 8, for example, for the Exif image file "DSC00001.JPG" only "SND00001.WAV" is given as the related Exif audio file.

When there are three Exif audio files "SND00001.WAV", "SND00002.WAV" and "SND00003.WAV", the Exif image file name for each of them, "DSC00001.JPG," is indicated. By combining multiple relational information, a variety of playback possibilities can be supported. The method of using relational information is left to the implementation on the playback side. Since this information is an ASCII character string, it is terminated by NULL.

Table 8 Mapping between Image and Audio Files

	Relationship	Exif Image File	Exif Audio File
[1]	1 to 1	DSC00001.JPG ←——————→	SND00001.WAV
[2]	Plural to 1	DSC00001.JPG ←——— DSC00002.JPG DSC00003.JPG	SND00001.WAV
[3]	1 to plural	DSC00001.JPG ←——————→	SND00001.WAV SND00002.WAV SND00003.WAV

When this tag is used to map audio files, the relation of the audio file to image data must also be indicated on the audio file end.

```
Tag     =   40964 (A004.H)
Type    =   ASCII
Count   =   13
```

Default   =   none

F. Tags Relating to Date and Time

DateTimeOriginal

   The date and time when the original image data was generated. For a DSC the date and time the picture was taken are recorded. The format is "YYYY:MM:DD HH:MM:SS" with time shown in 24-hour format, and the date and time separated by one blank character [20.H]. When the date and time are unknown, all the character spaces except colons (":") may be filled with blank characters, or else the Interoperability field may be filled with blank characters. The character string length is 20 bytes including NULL for termination. When the field is left blank, it is treated as unknown.

  Tag = 36867 (9003.H)

  Type = ASCII

  Count = 20

  Default = none

DateTimeDigitized

The date and time when the image was stored as digital data. If, fo r example, an image was captured by DSC and at the same time the file was recorded, then the *DateTimeOriginal* and *DateTimeDigitized* will have the same contents. The format is "YYYY:MM:DD HH:MM:SS" with time shown in 24-hour format, and the date and time separated by one blank character [20.H]. When the date and time are unknown, all the character spaces except colons (":") may be filled with blank characters, or else the Interoperability field may be filled with blank characters. The character string length is 20 bytes including NULL for termination. When the field is left blank, it is treated as unknown.

  Tag = 36868 (9004.H)

  Type = ASCII

  Count = 20

  Default = none

SubsecTime

A tag used to record fractions of seconds for the *DateTime* tag.

  Tag = 37520 (9290.H)

  Type = ASCII

  Count = Any

  Default = none

SubsecTimeOriginal

A tag used to record fractions of seconds for the *DateTimeOriginal* tag.

Tag	=	37521 (9291.H)
Type	=	ASCII
N	=	Any
Default	=	none

SubsecTimeDigitized

A tag used to record fractions of seconds for the *DateTimeDigitized* tag.

Tag	=	37522 (9292.H)
Type	=	ASCII
N	=	Any
Default	=	none

Note: Recording subsecond data (*SubsecTime, SubsecTimeOriginal, SubsecTimeDigitized*)

The tag type is ASCII and the string length including NULL is variable length. When the number of valid digits is up to the second decimal place, the subsecond value goes in the Value position. When it is up to four decimal places, an address value is Interoperability, with the subsecond value put in the location pointed to by that address. (Since the count of ASCII type field Interoperability is a value that includes NULL, when the number of valid digits is up to four decimal places the count is 5, and the offset value goes in the Value Offset field. See section 2.6.2.) Note that the subsecond tag differs from the *DateTime* tag and other such tags already defined in TIFF Rev. 6.0, and that both are recorded in the Exif IFD.

Ex.: September 9, 1998, 9:15:30.130

(the number of valid digits is up to the third decimal place)

DateTime   1996:09:01 09:15:30 [NULL]

SubSecTime   130 [NULL]

If the string length is longer than the number of valid digits, the digits are aligned with the start of the area and the rest is filled with blank characters [20.H]. If the subsecond data is unknown, the Interoperability area can be filled with blank characters.

Examples when subsecond data is 0.130 seconds:

Ex. 1) '1','3','0',[NULL]

Ex. 2) '1','3','0',[20.H],[NULL]

Ex. 3) '1','3','0', [20.H], [20.H], [20.H], [20.H], [20.H], [NULL]

Example when subsecond data is unknown:

Ex. 4) [20.H], [20.H], [20.H], [20.H], [20.H], [20.H], [20.H], [20.H], [NULL]

G. Tags Relating to Picture-Taking Conditions

ExposureTime

Exposure time, given in seconds (sec).

    Tag   =   33434 (829A.H)
    Type   =   RATIONAL
    Count   =   1
    Default =   none

ShutterSpeedValue

Shutter speed. The unit is the APEX (Additive System of Photographic Exposure) setting (see Appendix C).

    Tag   =   37377 (9201.H)
    Type   =   SRATIONAL
    Count   =   1
    Default =   none

ApertureValue

The lens aperture. The unit is the APEX value.

    Tag   =   37378 (9202.H)
    Type   =   RATIONAL
    Count   =   1
    Default =   none

BrightnessValue

The value of brightness. The unit is the APEX value. Ordinarily it is given in the range of -99.99 to 99.99.

    Tag   =   37379 (9203.H)
    Type   =   SRATIONAL
    Count   =   1
    Default =   none

ExposureBiasValue

The exposure bias. The unit is the APEX value. Ordinarily it is given in the range of –99.99 to 99.99.

    Tag   =   37380 (9204.H)
    Type   =   SRATIONAL
    Count   =   1
    Default =   none

MaxApertureValue

The smallest F number of the lens. The unit is the APEX value. Ordinarily it is given in the range of 00.00 to 99.99, but it is not limited to this range.

```
Tag      =   37381 (9205.H)
Type     =   RATIONAL
Count    =   1
Default  =   none
```

SubjectDistance

The distance to the subject, given in meters.

```
Tag      =   37382 (9206.H)
Type     =   RATIONAL
Count    =   1
Default  =   none
```

MeteringMode

The metering mode.

```
Tag      =   37383 (9207.H)
Type     =   SHORT
Count    =   1
Default  =   0
```

```
        0        =   unknown
        1        =   Average
        2        =   CenterWeightedAverage
        3        =   Spot
        4        =   MultiSpot
        5        =   Pattern
        6        =   Partial
   7 to 254      =   reserved
       255       =   other
```

LightSource

The kind of light source.

```
Tag      =   37384 (9208.H)
Type     =   SHORT
Count    =   1
Default  =   0
```

0	=	unknown
1	=	Daylight
2	=	Fluorescent
3	=	Tungsten
17	=	Standard light A
18	=	Standard light B
19	=	Standard light C
20	=	D55
21	=	D65
22	=	D75
23 to 254	=	reserved
255	=	other

Flash

This tag is recorded when an image is taken using a strobe light (flash). Bit 0 indicates the flash firing status, and bits 1 and 2 indicate the flash return status (see Fig. 10).
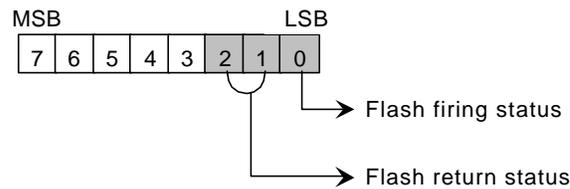

Fig. 10 Bit Coding of the Flash Tag

Tag = 37385 (9209.H)

Type = SHORT

Count = 1

Values for bit 0 indicating whether the flash fired.

0b	=	Flash did not fire.
1b	=	Flash fired.

Values for bits 1 and 2 indicating the status of returned light.

00b	=	No strobe return detection function
01b	=	reserved
10b	=	Strobe return light not detected.
11b	=	Strobe return light detected.

Resulting Flash tag values.

0000.H	=	Flash did not fire.
0001.H	=	Flash fired.
0005.H	=	Strobe return light not detected.

```
0007.H   =   Strobe return light detected.

Other    =   reserved
```

FocalLength

The actual focal length of the lens, in mm. Conversion is not made to the focal length of a 35 mm film camera.

```
Tag       = 37386 (920A.H)

Type      = RATIONAL

Count     = 1

Default   = none
```

FNumber

```
The F number.

Tag       = 33437 (829D.H)

Type      = RATIONAL

Count     = 1

Default   = none
```

ExposureProgram

The class of the program used by the camera to set exposure when the picture is taken. The tag values are as follows.

```
Tag       = 34850 (8822.H)

Type      = SHORT

Count     = 1

Default   = 0

    0         =  Not defined

    1         =  Manual

    2         =  Normal program

    3         =  Aperture priority

    4         =  Shutter priority

    5         =  Creative program (biased toward depth of field)

    6         =  Action program (biased toward fast shutter speed)

    7         =  Portrait mode (for closeup photos with the background out of focus)

    8         =  Landscape mode (for landscape photos with the background in focus)

    9 to 255  =  reserved
```

SpectralSensitivity

Indicates the spectral sensitivity of each channel of the camera used. The tag value is an ASCII string compatible with the standard[xiii] developed by the ASTM Technical committee.

Tag   = 34852 (8824.H)

Type   = ASCII

Count   = Any

Default = none

ISOSpeedRatings

Indicates the ISO Speed and ISO Latitude of the camera or input device as specified in ISO 12232[xiv].

Tag   = 34855 (8827.H)

Type   = SHORT

Count   = Any

Default = none

OECF

Indicates the Opto-Electric Conversion Function (OECF) specified in ISO 14524[xv]. *OECF* is the relationship between the camera optical input and the image values.

Tag   = 34856 (8828.H)

Type   = UNDEFINED

Count   = ANY

Default = none

When this tag records an *OECF* of m rows and n columns, the values are as in Fig. 11.

Length	Type	Meaning
2	SHORT	Columns = n
2	SHORT	Rows = m
Any	ASCII	0th column item name (NULL terminated)
:	:	:
Any	ASCII	n-1th column item name (NULL terminated)
8	SRATIONAL	OECF value [0,0]
:	:	:
8	SRATIONAL	OECF value [n-1,0]
8	SRATIONAL	OECF value [0,m-1]
:	:	:
8	SRATIONAL	OECF value [n-1,m-1]

Fig. 11 OECF Description

Table 9 gives a simple example.

Table 9 Example of Exposure and RGB Output Level

Camera log Aperture	R Output Level	G Output Level	B Output Level
-3.0	10.2	12.4	8.9
-2.0	48.1	47.5	48.3
-1.0	150.2	152.0	149.8

FlashEnergy

Indicates the strobe energy at the time the image is captured, as measured in Beam Candle Power Seconds (BCPS).

Tag = 41483 (A20B.H)

Type = RATIONAL

Count = 1

Default = none

SpatialFrequencyResponse

This tag records the camera or input device spatial frequency table and SFR values in the direction of image width, image height, and diagonal direction, as specified in ISO 12233[xvi].

Tag = 41484 (A20CH)

Type = UNDEFINED

Count = ANY

Default = none

When the spatial frequency response for m rows and n columns is recorded, the values are as shown in Fig. 12.

Length	Type	Meaning
2	SHORT	Columns = n
2	SHORT	Rows = m
Any	ASCII	0th column item name (NULL terminated)
:	:	:
Any	ASCII	n-1th column item name (NULL terminated)
8	RATIONAL	SFR value [0,0]
:	:	:
8	RATIONAL	SFR value [n-1,0]
8	RATIONAL	SFR value [0,m-1]
:	:	:
8	RATIONAL	SFR value [n-1,m-1]

Fig. 12 Spatial Frequency Response Description

Table 10 gives a simple example.

Table 10 Example of Spatial Frequency Response

Spatial Frequency (lw/ph)	Along Image Width	Along Image Height
	1.00	1.00
0.2	0.90	0.95
0.3	0.80	0.85

FocalPlaneXResolution

Indicates the number of pixels in the image width (X) direction per *FocalPlaneResolutionUnit* on the camera focal plane.

Tag   = 41486 (A20E.H)

Type   = RATIONAL

Count   = 1

Default = none

FocalPlaneYResolution

Indicates the number of pixels in the image height (Y) direction per *FocalPlaneResolutionUnit* on the camera focal plane.

Tag   = 41487 (A20F.H)

Type   = RATIONAL

Count   = 1

Default = none

FocalPlaneResolutionUnit

Indicates the unit for measuring *FocalPlaneXResolution* and *FocalPlaneYResolution*. This value is the same as the *ResolutionUnit*.

Tag   = 41488 (A210.H)

Type   = SHORT

Count   = 1

Default = 2 (inch)

Note on use of tags concerning focal plane resolution

These tags record the actual focal plane resolutions of the main image which is written as a file after processing instead of the pixel resolution of the image sensor in the camera. It should be noted carefully that the data from the image sensor is resampled.

These tags are used at the same time as a FocalLength tag when the angle of field of the recorded image is to be calculated precisely.

SubjectLocation

Indicates the location of the main subject in the scene. The value of this tag represents the pixel at the center of the main subject relative to the left edge, prior to rotation processing as per the *Rotation* tag. The first value indicates the X column number and second indicates the Y row number.

Tag   =   41492 (A214.H)

Type   =   SHORT

Count   =   2

Default =   none

ExposureIndex

Indicates the exposure index selected on the camera or input device at the time the image is captured.

Tag   =   41493 (A215.H)

Type   =   RATIONAL

Count   =   1

Default =   none

SensingMethod

Indicates the image sensor type on the camera or input device. The values are as follows.

Tag   =   41495 (A217.H)

Type   =   SHORT

Count   =   1

Default =   none

   1   =   Not defined

   2   =   One-chip color area sensor

   3   =   Two-chip color area sensor

   4   =   Three-chip color area sensor

   5   =   Color sequential area sensor

   7   =   Trilinear sensor

   8   =   Color sequential linear sensor

   Other   =   reserved

FileSource

Indicates the image source. If a DSC recorded the image, this tag value of this tag always be set to 3, indicating that the image was recorded on a DSC.

Tag   = 41728 (A300.H)

Type   = UNDEFINED

Count   = 1

Default   = 3

   3   = DSC

   Other   = reserved

SceneType

Indicates the type of scene. If a DSC recorded the image, this tag value must always be set to 1, indicating that the image was directly photographed.

   Tag   = 41729 (A301.H)

   Type   = UNDEFINED

   Count   = 1

   Default   = 1

     1   = A directly photographed image

     Other   = reserved

CFAPattern

Indicates the color filter array (CFA) geometric pattern of the image sensor when a one-chip color area sensor is used. It does not apply to all sensing methods.

   Tag   = 41730 (A302.H)

   Type   = UNDEFINED

   Count   = ANY

Fig. 13 shows how a CFA pattern is recorded for a one-chip color area sensor when the color filter array is repeated in $m \times n$ (vertical x lateral) pixel units.

Length	Type	Meaning
2	SHORT	Horizontal repeat pixel unit = n
2	SHORT	Vertical repeat pixel unit = m
1	BYTE	CFA value [0.0]
:	:	:
1	BYTE	CFA value [n-1.0]
1	BYTE	CFA value [0.m-1]
:	:	:
1	BYTE	CFA value [n-1.m-1]

Fig. 13 CFA Pattern Description

The relation of color filter color to CFA value is shown in Table 11.

Table 11 Color Filter Color and CFA Value

Filter Color	CFA Value
RED	00.H
GREEN	01.H
BLUE	02.H
CYAN	03.H
MAGENTA	04.H
YELLOW	05.H
WHITE	06.H

For example, when the CFA pattern values are {0002.H, 0002.H, 01.H, 00.H, 02.H, 01.H}, the color filter array is as shown in Fig. 14.

G	R	G	R	....
B	G	B	G	....
G	R	G	R	....
B	G	B	G	....

Reference for distance to destination	GPSDestDistanceRef	25	19	ASCII	2
Distance to destination	GPSDestDistance	26	1A	RATIONAL	1

A. Tags Relating to GPS

GPSVersionID

Indicates the version of *GPSInfoIFD*. The version is given as 2.0.0.0. This tag is mandatory when *GPSInfo* tag is present. (Note: The *GPSVersionID* tag is given in bytes, unlike the *ExifVersion* tag. When the version is 2.0.0.0, the tag value is 02000000.H.)

```
Tag       =  0 (0.H)
Type      =  BYTE
Count     =  4
Default   =  2.0.0.0
    2.0.0.0  =  Version 2.0
    Other    =  reserved
```

GPSLatitudeRef

Indicates whether the latitude is north or south latitude. The ASCII value 'N' indicates north latitude, and 'S' is south latitude.

```
Tag       =  1 (1.H)
Type      =  ASCII
Count     =  2
Default   =  none
    'N'      =  North latitude
    'S'      =  South latitude
    Other    =  reserved
```

GPSLatitude

Indicates the latitude. The latitude is expressed as three RATIONAL values giving the degrees, minutes, and seconds, respectively. When degrees, minutes and seconds are expressed, the format is dd/1,mm/1,ss/1. When degrees and minutes are used and, for example, fractions of minutes are given up to two decimal places, the format is dd/1,mmmm/100,0/1.

```
Tag       =  2 (2.H)
Type      =  RATIONAL
Count     =  3
Default   =  none
```

GPSLongitudeRef

Indicates whether the longitude is east or west longitude. ASCII 'E' indicates east longitude, and 'W' is west

longitude.

    Tag   =   3 (3.H)

    Type   =   ASCII

    Count   =   2

    Default   =   none

        'E'   =   East longitude

        'W'   =   West longitude

        Other   =   reserved

GPSLongitude

Indicates the longitude. The longitude is expressed as three RATIONAL values giving the degrees, minutes, and seconds, respectively. When degrees, minutes and seconds are expressed, the format is ddd/1,mm/1,ss/1. When degrees and minutes are used and, for example, fractions of minutes are given up to two decimal places, the format is ddd/1,mmmm/100,0/1.

    Tag   =   4 (4.H)

    Type   =   RATIONAL

    Count   =   3

    Default   =   none

GPSAltitudeRef

Indicates the altitude used as the reference altitude. In this version the reference altitude is sea level, so this tag must be set to 0. The reference unit is meters. Note that this tag is BYTE type, unlike other reference tags.

    Tag   =   5 (5.H)

    Type   =   BYTE

    Count   =   1

    Default   =   0

        0   =   Sea level

        Other   =   reserved

GPSAltitude

Indicates the altitude based on the reference in *GPSAltitudeRef*. Altitude is expressed as one RATIONAL value. The reference unit is meters.

    Tag   =   6 (6.H)

    Type   =   RATIONAL

    Count   =   1

    Default   =   none

GPSTimeStamp

Indicates the time as UTC (Coordinated Universal Time). TimeStamp is expressed as three RATIONAL values giving the hour, minute, and second.

```
Tag      =   7 (7.H)
Type     =   RATIONAL
Count    =   3
Default  =   none
```

GPSSatellites

Indicates the GPS satellites used for measurements. This tag can be used to describe the number of satellites, their ID number, angle of elevation, azimuth, SNR and other information in ASCII notation. The format is not specified. If the GPS receiver is incapable of taking measurements, value of the tag must be set to NULL.

```
Tag      =   8 (8.H)
Type     =   ASCII
Count    =   Any
Default  =   none
```

GPSStatus

Indicates the status of the GPS receiver when the image is recorded. 'A' means measurement is in progress, and 'V' means the measurement is Interoperability.

```
Tag      =   9 (9.H)
Type     =   ASCII
Count    =   2
Default  =   none
    'A'      =   Measurement in progress
    'V'      =   Measurement Interoperability
    Other    =   reserved
```

GPSMeasureMode

Indicates the GPS measurement mode. '2' means two-dimensional measurement and '3' means three-dimensional measurement is in progress.

```
Tag      =   10 (A.H)
Type     =   ASCII
Count    =   2
Default  =   none
    '2'      =   2-dimensional measurement
    '3'      =   3-dimensional measurement
```

```
            Other    =  reserved
```

GPSDOP

Indicates the GPS DOP (data degree of precision). An HDOP value is written during two-dimensional measurement, and PDOP during three-dimensional measurement.

```
    Tag      =   11 (B.H)
    Type     =   RATIONAL
    Count    =   1
    Default  =   none
```

GPSSpeedRef

Indicates the unit used to express the GPS receiver speed of movement. 'K' 'M' and 'N' represents kilometers per hour, miles per hour, and knots.

```
    Tag      =   12 (C.H)
    Type     =   ASCII
    Count    =   2
    Default  =   'K'
        'K'      =  Kilometers per hour
        'M'      =  Miles per hour
        'N'      =  Knots
        Other    =  reserved
```

GPSSpeed

Indicates the speed of GPS receiver movement.

```
    Tag      =   13 (D.H)
    Type     =   RATIONAL
    Count    =   1
    Default  =   none
```

GPSTrackRef

Indicates the reference for giving the direction of GPS receiver movement. 'T' denotes true direction and 'M' is magnetic direction.

```
    Tag      =   14 (E.H)
    Type     =   ASCII
    Count    =   2
    Default  =   'T'
        'T'      =  True direction
```

'M'	=	Magnetic direction
Other	=	reserved

GPSTrack

Indicates the direction of GPS receiver movement. The range of values is from 0.00 to 359.99.

Tag	=	15 (F.H)
Type	=	RATIONAL
Count	=	1
Default	=	none

GPSImgDirectionRef

Indicates the reference for giving the direction of the image when it is captured. 'T' denotes true direction and 'M' is magnetic direction.

Tag	=	16 (10.H)
Type	=	ASCII
Count	=	2
Default	=	'T'
'T'	=	True direction
'M'	=	Magnetic direction
Other	=	reserved

GPSImgDirection

Indicates the direction of the image when it was captured. The range of values is from 0.00 to 359.99.

Tag	=	17 (11.H)
Type	=	RATIONAL
Count	=	1
Default	=	none

GPSMapDatum

Indicates the geodetic survey data used by the GPS receiver. If the survey data is restricted to Japan, the value of this tag is 'TOKYO' or 'WGS-84'. If a *GPS Info* tag is recorded, it is strongly recommended that this tag be recorded.

Tag	=	18 (12.H)
Type	=	ASCII
Count	=	Any
Default	=	none

GPSDestLatitudeRef

Indicates whether the latitude of the destination point is north or south latitude. The ASCII value 'N' indicates north latitude, and 'S' is south latitude.

    Tag   = 19 (13.H)
    Type   = ASCII
    Count   = 2
    Default = none
        'N'   = North latitude
        'S'   = Sourth latitude
        Other   = reserved

GPSDestLatitude

Indicates the latitude of the destination point. The latitude is expressed as three RATIONAL values giving the degrees, minutes, and seconds, respectively. When degrees, minutes and seconds are expressed, the format is dd/1,mm/1,ss/1. When degrees and minutes are used and, for example, fractions of minutes are given up to two decimal places, the format is dd/1,mmmm/100,0/1.

    Tag   = 20 (14.H)
    Type   = RATIONAL
    Count   = 3
    Default = none

GPSDestLongitudeRef

Indicates whether the longitude of the destination point is east or west longitude. ASCII 'E' indicates east longitude, and 'W' is west longitude.

    Tag   = 21 (15.H)
    Type   = ASCII
    Count   = 2
    Default = none
        'E'   = East longitude
        'W'   = West longitude
        Other   = reserved

GPSDestLongitude

Indicates the longitude of the destination point. The longitude is expressed as three RATIONAL values giving the degrees, minutes, and seconds, respectively. When degrees, minutes and seconds are expressed, the format is ddd/1,mm/1,ss/1. When degrees and minutes are used and, for example, fractions of minutes are given up to two decimal places, the format is ddd/1,mmmm/100,0/1.

```
Tag      =   22 (16.H)

Type     =   RATIONAL

Count    =   3

Default  =   none
```

GPSDestBearingRef

Indicates the reference used for giving the bearing to the destination point. 'T' denotes true direction and 'M' is magnetic direction.

```
Tag      =   23 (17.H)

Type     =   ASCII

Count    =   2

Default  =   'T'

    'T'      =   True direction

    'M'      =   Magnetic direction

    Other    =   reserved
```

GPSDestBearing

Indicates the bearing to the destination point. The range of values is from 0.00 to 359.99.

```
Tag      =   24 (18.H)

Type     =   RATIONAL

Count    =   1

Default  =   none
```

GPSDestDistanceRef

Indicates the unit used to express the distance to the destination point. 'K', 'M' and 'N' represent kilometers, miles and knots.

```
Tag      =   25 (19.H)

Type     =   ASCII

Count    =   2

Default  =   'K'

    'K'      =   Kilometers

    'M'      =   Miles

    'N'      =   Knots

    Other    =   reserved
```

GPSDestDistance

Indicates the distance to the destination point.

Tag   =   26 (1A.H)

Type   =   RATIONAL

Count   =   1

Default   =   none

Note: When the tag Type is ASCII, it must be terminated with NULL.

It must be noted carefully that since the value count includes the terminator NULL, the total count is the number of data+1. For example, *GPSLatitudeRef* cannot have any values other than Type ASCII 'N' or 'S'; but because the terminator NULL is added, the value of N is 2.

2.6.7. Interoperability IFD Attribute Information

The attached information(field name, code) stored in Interoperability IFD is listed in Table 12-2 and the meaning will be explained also.

Table 13   Interoperability IFD Attribute Information

Tag Name	Field Name	Tag ID Dec	Tag ID Hex	Type	Count
A. Attached Information Related to Interoperability					
Interoperability Identification	Interoperability Index	0	0	ASCII	Any

A. Tags Relating to Interoperability

The rules for Exif image files defines the description of the following tag only. Other tags stored in Interoperability IFD may be defined dependently to each Interoperability rule.

Interoperability Index

Indicates the identification of the Interoperability rule.

Use "R98" for stating ExifR98 Rules. Four bytes used including the termination code(NULL). See the separate volume of Recommended Exif Interoperability Rules (ExifR98) for other tags used for ExifR98.

```
Tag      =   1   1.H
Type     =   ASCII
Count    =   Any
Default  = none
   "R98"      = Recommended Exif Interoperability Rules (ExifR98)
```

2.6.8. Tag Support Levels

The tags and their support levels are given here.

A. Primary Image (0th IFD) Support Levels

The support levels of primary image (0th IFD) tags are given in Table 14, Table 15, Table 16 and Table 17.

Table 14　Tag Support Levels（1）　- 0th IFD TIFF Tags -

Tag Name	Field Name	Tag ID Dec	Hex	Uncompressed Chunky	Planar	YCC	Compressed

The support levels of thumbnail (1st IFD) tags are shown in Table 18.

Table 18　Tag Support Levels (5)　- 1st IFD TIFF Tag -

2.7. JPEG Marker Segments Used in Exif

In addition to the compressed data (Interoperability coded data), a compressed file contains one each of the marker segments APP1, DQT, DHT, SOF and SOS. The compressed data begins with an SOI and ends with an EOI marker. A restart marker (DRI, RSTm) can be inserted optionally. Another option is to have two or more APP2 marker segments. APPn other than APP1 and APP2 or COM segments are not used by Exif. However Exif readers should be designed skip over unknown APPn and COM.

APP1 must be recorded immediately after SOI, and if there is an APP2 it follows after APP1. DQT, DHT, DRI and SOF come after APP2 and before SOS, in any order.

The marker segments used in Exif are listed in Table 19.

Table 19   Marker Segments

	Marker Name	Marker Code	Description
SOI	Start of Image	FFD8.H	Start of compressed data
APP1	Application Segment 1	FFE1.H	Exif attribute information
APP2	Application Segment 2	FFE2.H	Exif extended data
DQT	Define Quantization Table	FFDB.H	Quantization table definition
DHT	Define Huffman Table	FFC4.H	Huffman table definition
DRI	Define Restart Interoperability	FFDD.H	Restart Interoperability definition
SOF	Start of Frame	FFC0.H	Parameter data relating to frame
SOS	Start of Scan	FFDA.H	Parameters relating to components
EOI	End of Image	FFD9.H	End of compressed data

The data structures of markers defined in JPEG Baseline DCT and used in Exif compressed files, as well as the APP1 and APP2 data structures defined specifically for this standard, are explained below.

2.7.1. JPEG Marker Segments

The data structure of JPEG marker segments other than APP1 and APP2 is noted below.

A. Start of compressed data (SOI: Start of Image)

SOI is a marker code indicating the start of compressed data (see Fig. 15).

Address Offset (Hex)	Code (Hex)	Meaning
+00	FF	Marker Prefix
+01	D8	SOI

Fig. 15   SOI Structure

B. Quantization table definition (DQT: Define Quantization Table)

DQT is a marker code defining a quantization table.

As many as three kinds of tables can be recorded with a precision of 8 bits (Pq=0). All quantization tables must be defined in one DQT marker segment; recording of multiple DQT markers is not allowed. The table may have any values (see Fig. 16). DQT, DHT, DRI and SOF may line up in any order, but must be recorded after APP1 (or APP2 if any) and before SOS.

Address Offset (Hex)	Code (Hex)	Meaning
+00	FF	Marker Prefix
+01	DB	DQT
+02	00	Length of field
	C5	2+(1+64)*3=197 (Bytes)
+04	00	Y: Pq=0, Nq=0
+05	:	Quantization table Y:Q0
	:	:
	:	:
	:	Quantization table Y:Q63
+45	01	Cb: Pq=0, Nq=1
+46	:	Quantization table Cb:Q0
	:	:
	:	:
	:	Quantization table Cb:Q63
+86	02	Cr: Pq=0, Nq=1
+87	:	Quantization table Cr:Q0
	:	:
	:	:
	:	Quantization table Cr:Q63

Fig. 16 DQT Structure (with three quantization tables)

C. Huffman table definition (DHT: Define Huffman Table)

DHT is a marker code defining a Huffman table.

In this standard a single component shall have a Huffman table consisting of a set of DC and AC, and each component must be mapped to one or another of the Huffman tables defined by DHT. All Huffman tables must be recorded in one DHT marker segment; recording of multiple DHT markers is not allowed. A Huffman table may have any values, or the JPEG reference values may be used as the base table (see Fig. 17).

DQT, DHT, DRI and SOF may line up in any order, but must be recorded after APP1 (or APP2 if any) and before SOS.

Address Offset (Hex)	Code (Hex)	Meaning
+00	FF	Marker Prefix
+01	C4	DHT
+02	01	Length of field
	A2	2+(1+16+12+1+16+162)*2 = 418 Bytes
+04	00	Table number Y-DC : 00
+05	: : :	DHT parameter
+21	10	Table number Y-AC : 10
+22	: : :	DHT parameter
+D4	01	Table number C-DC : 01
+D5	: : :	DHT parameter
+F1	11	Table number C-AC : 11
+F2	: : :	DHT parameter

Fig. 17 DHT Structure

D. Restart Interoperability definition (DRI: Define Restart Interoperability)

DRI is a marker defining the Interoperability at which restart markers are inserted (see Fig. 18). The recording of DRI and insertion of restart markers are optional. If restart markers are inserted, DRI shall be recorded and its values shall be 4 MCU (Minimum Coding Unit), i.e., 64 pixel units, regardless of whether 4:2:2 or 4:2:0 is used for color sampling (see Appendix F). Only one DRI shall be recorded.

DQT, DHT, DRI and SOF may line up in any order, but must be recorded after APP1 (or APP2 if any) and before SOS.

Address Offset (Hex)	Code (Hex)	Meaning
+00	FF	Marker Prefix
+00	DD	DRI
+02	00	Length of field 2+2 = 4 (Bytes)
+04	XX	00
	YY	04

Fig. 18 DRI Structure

E. Frame header (SOF: Start of Frame)

SOF is a marker code indicating the start of a frame segment and giving various parameters for that frame (see Fig. 19).

DQT, DHT, DRI and SOF may line up in any order, but must be recorded after APP1 (or APP2 if any) and before SOS.

Address Offset (Hex)	Code (Hex)	Meaning
+00	FF	Marker Prefix
+00	C0	SOF
+02	00	Length of field
	11	2+1+2+2+1+2*3 = 17 (Bytes)
+04	08	Data precision (bits)
+05	XX	Vertical lines
	YY	XXYY (Hex) lines
+07	WW	Horizontal lines
	ZZ	WWZZ (Hex) pixels
+09	03	Components
+0A	01	Component number (1:Y)
+0B	21or22	H0 = 2, V0 = 1(4:2:2) or 2(4:2:0)
+0C	00	Quantization designation
+0D	02	Component number (2:Cb)
+0E	11	H1 =1, V1 = 1
+0F	01	Quantization designation
+10	03	Component number (3:Cr)
+11	11	H2 =1, V2 = 1
+12	02	Quantization designation

Fig. 19 SOF Structure

F. Scan header (SOS: Start of Scan)

SOS is a marker code giving various scan-related parameters (see Fig. 20).

Address Offset (Hex)	Code (Hex)	Meaning
+00	FF	Marker Prefix
+00	DA	SOS
+02	00	Length of field
	0C	2+1+3*2+3 = 12 (Bytes)
+04	03	Components in scan
+05	01	Component selector Y : 01
+06	00	Huffman table selector Y : 00
+07	02	Component selector Cb : 02
+08	11	Huffman table selector C : 11
+09	03	Component selector Cr : 03
+0A	11	Huffman table selector C : 11
+0B	00	Scan start position in block
+0C	3F	Scan end position in block
+0D	00	Successive approximation Bit position

Fig. 20 SOS Structure

G. Compressed data

Compressed data is byte data block Interoperability at the required ratio of Y:Cb:Cr and Huffman encoded. An EOB (End of Block) is inserted in each block when the last value of its DCT coefficient is 0. If restart marker insertion is defined in DRI, restart markers are inserted at 4 MCU Interoperability.

H. End of compressed data (EOI : End of Image)

EOI is a marker code indicating the end of Interoperability coded data, and is paired with SOI (see Fig. 21). No specification is made regarding data arrays that come after EOI.

Address Offset (Hex)	Code (Hex)	Meaning
+00	FF	Marker Prefix
+01	D9	EOI

Fig. 21 EOI Structure

2.7.2. Interoperability Structure of APP1 in Compressed Data

APP1 consists of an APP1 marker indicating that it is an application area, a length code indicating its size, and primary image attribute information patterned after the TIFF structure. The APP1 segment cannot record more than 64 Kbytes, a limitation that must be kept in mind when recording thumbnail images.

APP1 also records attribute information for JPEG compressed images. The features of this marker segment are described below.

A. Order of APP1 recording

APP1 is recorded immediately after the SOI marker indicating the start of the file (see Fig. 6).

B. APP1 Interoperability structure

APP1 consists of an APP1 marker, Exif ID code and the attribute information itself (see Fig. 22).

Address Offset (Hex)	Code (Hex)	Meaning
+00	FF	Marker Prefix
+01	E1	APP1
+02		Length of field
+04	45	'E'
+05	78	'x'
+06	69	'i'
+07	66	'f'
+08	00	NULL
+09	00	Padding
+0A		Attribute information

Fig. 22 Basic Structure of APP1 Marker Segment

C. Exif ID code

The Exif ID code indicates that the APP1 segment Interoperability is Exif format. After a 4-byte code, 00.H is recorded in 2 bytes. The reason for recording this code is to avoid duplication with other applications making use of JPEG application marker segments (APPn).

D. Attribute information

Attribute information is recorded in 2 IFDs (0th IFD, 1st IFD) following the TIFF structure, including the File Header. The 0th IFD records compressed image attributes (the image itself). The 1st IFD can be used for thumbnail images.

E. TIFF header

The TIFF header in APP1 constitutes 8 bytes of data, including the byte order and the Offset of IFD indicating the first IFD. The Offset is referenced to the address of the first byte of the Byte Order. For example, the Offset of IFD address in the TIFF Header is 4 (see Table 1).

F. Relation to JPEG marker segments

Attribute information is recorded in essentially the same format as that used to record uncompressed data attribute information. In order to avoid duplication, however, attribute information recorded in a JPEG marker segment is not recorded in APP1.

2.7.3. Interoperability Structure of APP2 in Compressed Data

APP2 consists of an APP2 marker indicating that it is an application area, a length code indicating its size, and FlashPix (see Appendix F) extensions. If there is no need to record extensions, this marker segment can be omitted.

There are two kinds of APP2 marker segments for recording FlashPix extensions.

One is a Contents List Segment recording a storage and stream list making up the extended data. One file contains only one contents list segment.

The second is a Stream Data Segment storing the data for each of the streams listed in the Contents List Segment. If necessary, there can be two or more APP2 marker segments for storing stream data.

In addition there is an APP2 segment reserved for FlashPix use, which is specified in the FlashPix standard.

The contents of data that can be recorded as stream data is left for future specification. It may include one or more Audio data.

A. Order of APP2 recording.

APP2 segments follow after the APP1 segment, in the order of Contents List Segment and Stream Data Segments. If there are two or more stream data segments, their order is as given in the contents list (see Fig. 6).

B. APP2 Interoperability structure

APP2 consists of an APP2 marker, ID code (FPXR), and Contents List or Stream Data (see Fig. 23).

Address Offset (Hex)	Code (Hex)	Meaning
+00	FF	Marker Prefix
+01	E2	APP2
+02		Length of field
+04	46	'F'
+05	50	'P'
+06	58	'X'
+07	52	'R'
+08	00	NULL
+09	00	Version
+0A		Contents List or Stream Data

Fig. 23 Basic Structure of APP2 Marker Segment

C. FPXR ID code

The FPXR ID code indicates that the APP2 segment contains FPXR data. It is a 4-byte code followed by 00.H recorded in 1 byte. The reason for recording this code is to avoid duplication with other applications making use of JPEG application marker segments (APPn). The subsequent byte gives the version number (00.H).

D. Contents list structure

The contents list segment lists the storages and streams to be created when the file is converted to a FlashPix image file. The first two bytes give the number of Interoperability.

The Interoperability fields on the contents list are as follows.

Entity size

Indicates the size of the stream, or else FFFFFFFF.H (in the case of a storage). It is recorded in big endian format.

Default value

A fixed value not set explicitly in the stream data segment but used as the default for each byte.

Storage/Stream name

The name of the storage and stream added for transformation to FlashPix. It is given as the full path name from the FlashPix source image object root storage. "/" represents a directory separator and must be the first character of the property value. This name is a 16-bit character string from the Unicode code page, with NULL termination. It is recorded in little endian format.

Entity class ID

The storage ClassID, given only in the case of a storage Interoperability. It is written as 16-bytes in little endian format.

The data structure of the Contents List Segment is given in Fig. 24.

Address Offset (Hex)	Bytes (Hex)	Code (Hex)	Meaning
+00	1	FF	Marker Prefix
+01	1	E2	APP2
+02	2		Length of field
+04	4		"FPXR"
+08	1	00	NULL
+09	1	00	Version
+0A	1	01	Contents List
+0B	2		Interoperability Count
+0C	4		Entity size 1
+11	1		Default value 0
+12	m_0		Storage or Stream name 0
+12+m_0	(n_0)		(Entity Class ID 0)
+12+m_0+n_0	4		Entity size 1
:	1		Default value 1
:	m_1		Storage or Stream name 1
:	(n_1)		(Entity Class ID 1)
:	:	:	:
:	:	:	:
:	4		Entity size l
:	1		Default value l
:	m_l		Storage or Stream name l
:	(n_l)		(Entity Class ID l)

Fig. 24 Contents List Segment Structure

E. Stream Data Segment structure

A stream data segment records part or all of the stream listed in the contents list segment. Because of the 64-Kbyte size limit of a JPEG marker segment, a stream longer than this must be recorded in two or more stream data segments. Instead of writing stream data directly in multiple stream data segments, the segments may be filled based on a fixed default. A stream data segment contains the following data.

Index into Contents Lists

The order of Interoperability recorded in a contents list segment starting from 0.

Offset into the full FlashPix stream

The offset to the first byte of stream data in the FlashPix stream.

Stream Data

The actual data stream recorded as extended data in the transformation to FlashPix. The length of this data is indicated by the length code in the stream data segment.

The data structure of a Stream Data Segment is given in Fig. 25.

Address Offset (Hex)	Bytes (Hex)	Code (Hex)	Meaning
+00	1	FF	Marker Prefix
+01	1	E2	APP2
+02	2		Length of field
+04	4		"FPXR"
+08	1	00	NULL
+09	1	00	Version
+0A	1	02	Stream Data
+0B	2	N	Index to Contents List
+0C	4	(Offset)	Offset to FlashPix stream
+11	Variable	(value)	Stream Data

Fig. 25 Stream Data Segment Structure

F. Reserved Segment (*Reserved for future use by the FlashPix format*)

This marker segment is reserved for future use. An example is given in Fig. 26.

Address Offset (Hex)	Bytes (Hex)	Code (Hex)	Meaning
+00	1	FF	Marker Prefix
+01	1	E2	APP2
+02	2		Length of field
+04	4		"FPXR"
+08	1	00	NULL
+09	1	00	Version
+0A	1	03	Reserved for FlashPix
+0B	: :	: :	

Fig. 26 Structure of Data Segment Reserved for FlashPix

2.8. Data Description

2.8.1. Stipulations on Compressed Image Size

The JPEG format is adopted for compressed images. Since JPEG compresses images in blocks of 8 x 8 pixels, preferably the pixel number set as the width and height of the image should be exact multiples of the MCU (multiples of 16 for width, and multiples of 8 for height if Y:Cb:Cr = 4:2:2, or 16 if Y:Cb:Cr = 4:2:0). It is not required, however, that all image data be fit within this range.

If a restart marker is inserted every 4 MCU for the sake of transformation to FlashPix, the width of the image must be an exact multiple of 4 MCU (64 pixels). There is no such restriction on height.

Specifications on inserting data to adjust the recorded image size relative to the valid image size, or padding, are given below.

A. Image size recording procedure in the Exif writer

An Exif writer shall record a compressed image with the image width information and height information set in accord with the stipulations below, and padded as necessary.

When the image is padded in the direction of width, the padding data must be appended at the right edge. Padding in the direction of height must be appended at the bottom edge.

The data used for padding is not specified.

Stipulations on image width

Image width information consists of the valid image width tag (*PixelXDimension*), SOF marker information, and JPEG compressed data. Of these three, the recording of a valid image width tag is mandatory.

Image width is padded to the right in the following cases. The value used for padding is not specified.

- When the image width is not an exact multiple of 16 and the JPEG block has unused capacity to be filled.

- When the image width is not a multiple of 64 and the insufficiency must be made up in order to insert restart markers.

The method of describing the various image width data with and without padding is given in Fig. 27. It must be noted carefully that the value of SOF is used in some cases to describe the valid image width, and in others to describe the image width after padding.
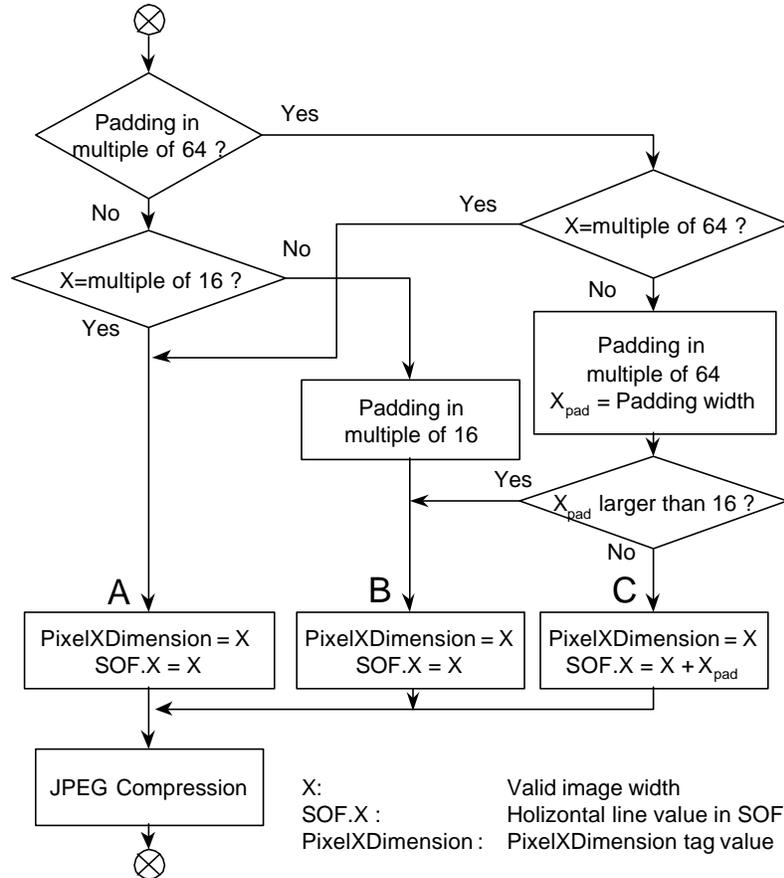

Fig. 27 Image Data Width Description

Table 20 gives examples of information recorded in the direction of image width and padding data width, for each of cases A, B, and C of Fig. 27.

Table 20 Typical Width Direction Information and Padding Data

	Valid Image Width	PixelXDimension	SOF Information	Compressed Data	Padding Width
A	640	640	640	640	0
B	634	634	634	640	6 (< 1MCU)
C	620	620	640	640	20 (> 1MCU)

Stipulations on image height

Image height information consists of the valid image height tag (*PixelYDimension*), SOF marker information, and JPEG compressed data. Of these three, the recording of a valid image height tag is mandatory.

The image height is padded in the following case. The padding value is not specified.

- When the image height is not an exact multiple of 16 and the JPEG block has unused capacity to be filled.

Insertion of a restart marker does not require padding. The method of recording the various image height data with and without padding is given in Fig. 28. The SOF marker always has the same value as the effective image height tag.
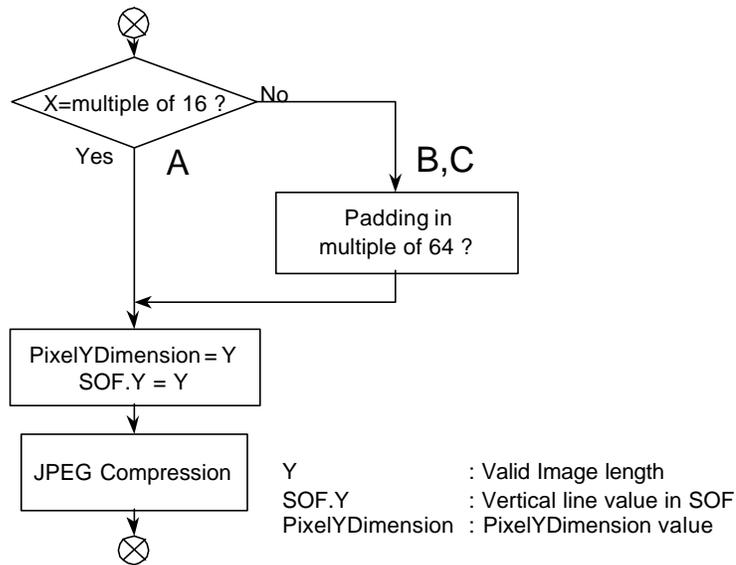

Fig. 28 Image Data Height Description

Table 21 gives examples of information recorded in the direction of image height and padding data height, for each of cases A, B, and C of Fig. 28.

Table 21 Typical Height Direction Information and Padding Data (when Y:Cb:Cr = 4:2:2)

	Valid Image Height	Valid Image Height Tag	SOF Information	Compressed Data	Padding Height
A	480	480	480	480	0
B	474	474	474	480	6 (< 1MCU)
C	460	460	460	464	4 (< 1MCU)

B. Image size reproduction procedure in the Exif reader

It is recommended that the Exif reader (and in particular, dedicated software) follow the procedure shown in Fig. 29 for reproducing images. First it expands the image based on the SOF information. Next it trims the image on the right and lower edges in accord with information in the valid image width tag and height tag, and reproduces the valid image data. If the SOF information and the valid image width and height tag information are the same, trimming is unnecessary.
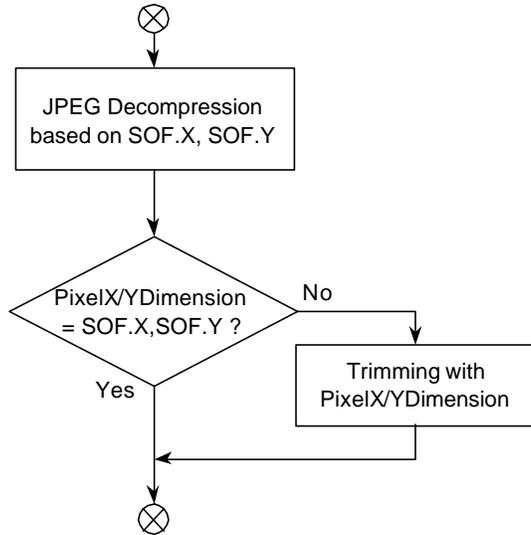

Fig. 29 Procedure for Image Data Reproduction

Some off-the-shelf software lacks a function for handling valid image width and height tags. If the valid image width differs from the number of horizontal pixels recorded in the SOF, padding data may be displayed. The padding data values should be chosen with this possibility in mind.

2.8.2. Stipulations on Thumbnails

A. Exif writer

The recording of thumbnail images is an optional specification of the Exif reader. It is therefore allowable to have Exif files with and without thumbnails. For details see section 2.5.5.

B. Exif reader

This format is designed so that the primary image will be reproduced intact whether or not thumbnail images are recorded in the file. It is assumed that even when functions are provided for viewing images on the camera or player, for viewing the process of image transfer from camera to PC, or for using thumbnails as an index display in the camera software or other image software, there will still be cases where the file is viewed without thumbnails. The creation and displaying of thumbnails can therefore be performed or not at the discretion of the user.

2.8.3. File Name Stipulations

A. Exif writer

The file name and characters used for file names are not specified, other than to stipulate the use of ASCII alphanumerics. (File names in Japanese or other character sets are not to be used.) File names shall be 8 characters or fewer, not including the extension. (Long file names are not to be used.) The file name extensions are ".JPG" for compressed data files and ".TIF" for uncompressed data files.

2.8.4. Byte Order Stipulations

A. Exif Reader

It is recommended that the Exif reader be able to reproduce Exif files recorded in both little endian and big endian formats.

3. Exif Audio File Specification

3.1. Outline of the Exif Audio File Specification

This chapter gives details of the audio file specification, covering the following items:

- Format version definition,

- Specifications relating to audio data,

- Basic structure of audio data,

- Chunks,

- File naming conventions.

3.2. Format Version

The version of the format specified here is recorded as 4 bytes (see section 3.6.3). The address bytes are recorded as A1, A2, B1, B2, starting with the lowest number. A1 and A2 store the upper part of the standard version, with the lower part stored in B1 and B2. When changes are made to the version number of this standard, the following rules apply:

- When the changes are such that data readers can properly recognize conventional information and skip the data that was recorded using newly added functions, the lower part of the version (B1, B2) is changed,

- When there is a possibility that a data reader implementing the old standard may operate incorrectly due to the new specifications, the upper part of the version (A1, A2) is changed.

Players should be able to play back files of versions earlier than the supported standard.

3.3. Definition of Terms

Terms and notation are used as follows in this standard:

- Text enclosed in " " is a character string, and " "Z means a character string ending in NULL (00.H),

- ".H" appended to a numerical value means it is hexadecimal notation.

- Unless otherwise indicated, other numerical values are given in decimal notation.

3.4. Specifications Relating to Audio Data

3.4.1. Sampling Frequency

The sampling frequency shall be any of 8.000 kHz, 11.025 kHz, 22.050 kHz or 44.100 kHz. Only 8.000 kHz shall be used for µ−LAW PCM in accord with ITU‑T G.711.

3.4.2. Bit Size

The bit size shall be 8 bits or 16 bits. Only 8 bits shall be used for µ-LAW PCM in accord with ITU‑T G.711; and only 4 bits shall be used for IMA-ADPCM in accord with the IMA (Interoperability Multimedia Association) specification.

3.4.3. Channels

The number of channels is either monaural or stereo (2 ch).

3.4.4. Compression Schemes

The following three compressions schemes are specified here:

- Uncompressed audio data: PCM ,
- Uncompressed audio data: µ-Law PCM (conforming to ITU-T G.711 [viii]) ,
- Compressed data: IMA -ADPCM [ix] .

3.5. Basic Structure of Audio Data

Exif audio files are based on the RIFF WAVE Form Audio File format [vii] adopted as a Windows™ standard audio file format, with the addition of various DSC attribute information as needed. Exif audio files are data-compatible with WAVE Form Audio files and can be played on accessories supplied with Windows™.

Of the general attribute information required by DSC applications, the common attributes are recorded on an *INFO list*, and the Exif-specific attributes are recorded in Exif chunks. The Exif chunks are provided to enable the addition of information as necessary, taking advantage of chunk extensibility. The method of recording data in the Exif-specific chunks is patterned after that for the *INFO list*.

3.5.1. Basic Structure of WAVE Form Audio Files

The WAVE Form Audio File format is based on the *RIFF (Resource Interoperability File Format)* tagged file structure.

A *RIFF* file consists of basic data blocks called chunks.

(1) *Chunk*

Using C language syntax, a chunk can be defined as a structure, like that in Equation 1. The chunk structure can also be expressed in graphical form as in Fig. 30.

```
    typedef struct {

            unsigned  long    ckID;              // 4-character code

            unsigned  long    ckSize;            // Size of member <ckData>

            unsigned  char    ckData[ckSize];    // The data in the chunk

    } CK;           - - - [Equation 1]
```

Address Offset
(Hex)　　　　　　Meaning

+00	ckID (4 Bytes)
+04	ckSize (4 Bytes)
+08	ckData[ckSize]

Fig. 30 Chunk Structure

Explanation

- *ckID* (chunk ID, a 4-character code) consists of from one to four ASCII alphanumerics, left-justified and filled with blank characters if less than four characters in length. Blanks cannot be inserted between characters. This four-character code identifies the contents of the chunk data, described later. Software processing the chunk is allowed to skip a chunk with an unknown chunk ID.

- *ckSize* (chunk Size) is a 32-bit unsigned integer giving the size (bytes) of the *ckData*[*ckSize*] (chunk Data). This size does not include padding bytes following the ckID, *ckSize* itself and *ckData*. The byte order is little endian (LSB first, MSB last). In the case of *RIFF* files, values of more than one byte are all written in little endian order. If two or more chunks follow in sequence, the value of chSize must be read properly in order to know the start address (ckID) of the next chunk.

- *ckData*[*ckSize*] (chunk Data) is the actual data included in that chunk, and may be recorded as binary data of either fixed length or variable length. The start of *ckData* is aligned with the *RIFF* file start position in word (16-bit) units. If the data size is an odd number of bytes, a padding byte with the value '0' is appended after the *ckData*. This padding byte is not included in the *ckSize* (chunk Size).

- *ckData*[*ckSize*] (chunk Data) can itself have a particular structure rather than being a simple byte array. That is, *ckData* itself can include a chunk (sub-chunk). In other words, chunks can be arranged hierarchically. Only certain chunks are allowed to contain sub-chunks. These are the *RIFF* chunk and *LIST* chunk described later below. Generally two or more sub-chunks may be contained in these chunks. All other chunks store only one binary data element in the *ckData*.

(2) *RIFF Form*

A *"RIFF* form" is a chunk with "*RIFF*" as its chunk ID (ckID); it is also used to mean a file format with the *RIFF* structure (*RIFF* file).

A "*RIFF* chunk" *ckData* (chunk data) consists of a 4-character code at the beginning called the *formType* (form type), followed by a sub-chunk.

A *RIFF* chunk is at the top of the chunk hierarchy. A *RIFF* form must have this chunk, but can have only one. All other chunks are sub-chunks of the *RIFF* chunk.

A form type is generally a code identifying the data contents, among other things. It is also possible to tell from this code what kind of sub-chunk a chunk contains. A form type must be registered. A registered form type is written in all upper-case letters.

Along with a form type, a chunk ID (ckID) must also be registered. A chunk ID in all upper-case letters indicates a general-purpose chunk that can be used with various form types. A chunk ID used with a specific form type is written in all lower-case letters.

An illustration of the *RIFF* chunk is given in Fig. 31.

Address Offset (Hex)	Code (Hex)	Meaning	
+00	52	"RIFF" (ckID)	
+01	49		
+02	46		
+03	46		
+04		ckSize (4 Bytes)	
+08		formType (4 Bytes)	RIFF chunk ckData [ckSize]
+0C		Subchunk 1	
:		Subchunk 2	
:		: : :	
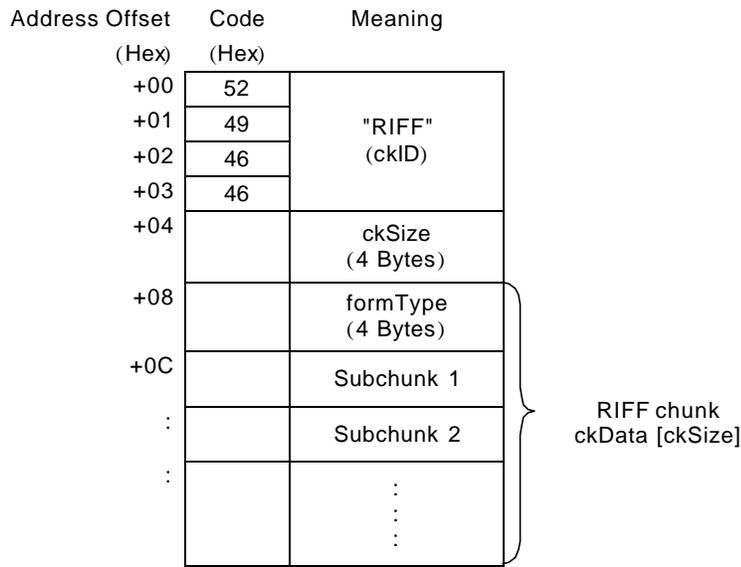

Fig. 31 RIFF Chunk Structure

Note:

Representative form types are given in Table 22. These are written in all upper-case letters because they are registered form types.

Table 22 Representative Form Types

Form Type	Name
PAL	Palette file form
RDIB	RIFF DIB (Device Independent Bitmap) form
RMID	RIFF MIDI form
RMMP	RIFF multimedia movie form
WAVE	WAVE Form Audio File format

(3) WAVE Form Audio File Format

The *WAVE* Form is one kind of *RIFF* form. It is a file for handling digitized sound data. The form type is *WAVE*, in upper-case letters.

The file extension for a *WAVE* Form Audio File is ".WAV".

The data structure of the *WAVE* Form Audio File format is shown in Fig. 32.

As is evident from Fig. 32, the chunk data (*ckData* [*ckSize*]) of a *RIFF* chunk generally consists of the *formType* ("*WAVE*"), *fmt-ck* (format chunk), *fact-ck* (fact chunk), and *data-ck* (data chunk). *fmt-ck* and *data-ck* are mandatory chunks, but *fact-ck* may be mandatory or not, depending on the format type (audio coding format) of the *WAVE* Form.

In addition to these, optional sub-chunks may be recorded and can store various attribute information These optional sub-chunks are not shown in Fig. 32.

Address Offset (Hex)	Code (Hex)	Meaning	Meaning	
+00	52	"RIFF" (ckID)		
+01	49			
+02	46			
+03	46			
+04		ckSize (4 Bytes)

:			ckData [ckSize]	
		data-ck	"data"	
			ckSize(4 Bytes)	
			ckData [ckSize]	
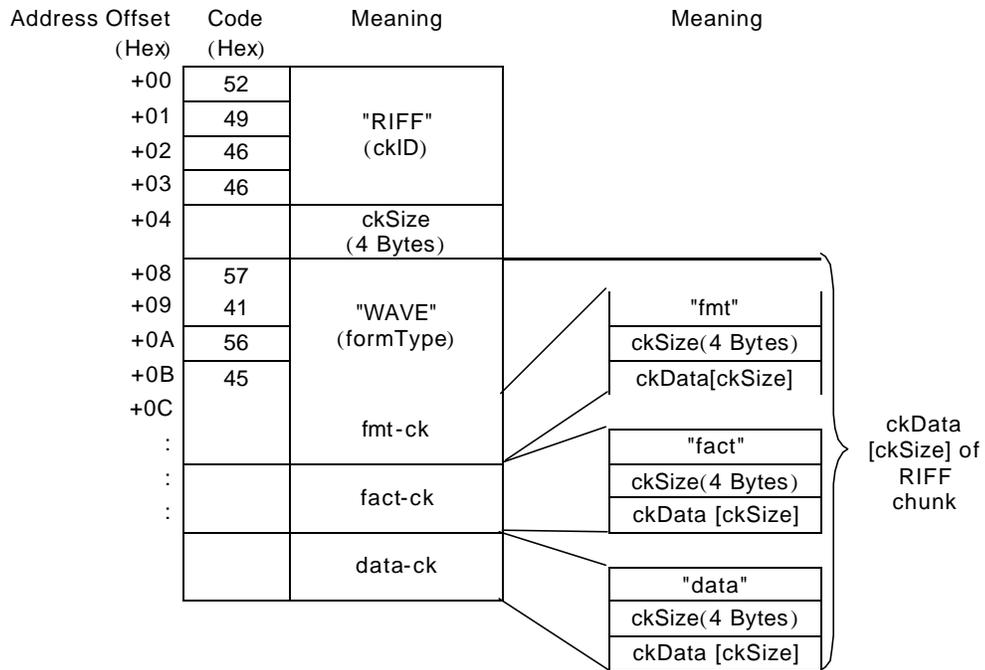

Fig. 32 Data Structure of the WAVE Form Audio File Format

<fmt-ck>

fmt-ck (format chunk) contains format information designating the format of audio data included in the *data-ck* (data chunk) described later below. The *ckID* (chunk ID) of *fmt-ck* is "fmt."

"fmt " is 3 characters long, so a blank character (20.H) goes at the end.

fmt-ck is mandatory and must always be recorded before *data-ck*.

Since *fmt-ck* has the chunk structure, *ckSize* and *ckData*[*ckSize*] are included as its members; but the contents of the *ckData* depend on the format type (audio coding format). This *ckData* consists of the structure given in Equation 2, and the byte array given in Equation 3.

```
    struct{
            unsigned int    wFormatTag;        // Format type
            unsigned int    nChannels;         // Number of channels
            unsigned long   nSamplesPerSec;    // Sampling rate
            unsignrd long   nAvgBytesPerSec;   // Average bytes per second
            unsigned int    nBlockAlign;       // Block alignment
            unsigned int    wBitsPerSample;    // Bits per sample
            unsigned int    cbSize;            // Additional bytes
    } WAVEFORMATEX;                                             - - -[Equation 2]
    unsigned char   extByte[cbSize];          // Additional byte array   - - -[Equation 3]
```

The meaning of each member of the format information is given in Table 23.

Table 23   Format Information Members

Member	Description
wFormatTag	An unsigned 16-bit integer indicating the format type (audio coding format) of the WAVE Form. Typical format types are given below. PCM (Pulse Code Modulation) format: 0001.H µ-Law format (ITU-T G.711): 0007.H IMA-ADPCM (DVI-ADPCM) format: 0011.H
nChannels	An unsigned 16-bit integer indicating the number of channels. Monaural is 1 and stereo is 2.
nSamplesPerSec	An unsigned 32-bit integer indicating the sampling rate (samples per second). Audio is played in each channel at this rate. In PCM format the common values of this member are 8.0kHz, 11.025kHz, 22.05kHz, and 44.1kHz.
nAvgBytesPerSec	An unsigned 32-bit integer indicating the average bytes per second, a value transferred to the data in data-ck. In PCM format, nAvgBytesPerSec is equivalent to the equation below. nChannels * wBitsPerSample/8
nBlockAlign	An unsigned 16-bit integer indicating the (byte unit) block alignment in data-ck. In PCM format, nBlockAlign is equivalent to the equation below. nChannels * wBitsPerSample/8
wBitsPerSample	An unsigned 16-bit integer indicating the bits per sample of each channel. In PCM format, this value is 8 or 16. In the case of compressed sound data, when this value cannot be defined it becomes '0'.
cbSize	An unsigned 16-bit integer indicating the size (in bytes) of the additional format information extByte[cbSize] appended after the WAVEFORMATEX structure. This information is used to store attributes added in non-PCM formats. If additional information is not needed, it becomes '0'. In PCM format, this member is not needed (the cbSize field itself is not necessary).
extByte[cbSize]	A byte array representing the additional format information appended after the WAVEFORMATEX structure. The meaning of this information depends on the format type. If the value of cbSize is 0, this field does not exist. In PCM format, both the cbSize field and extByte[cbSize] field are unnecessary.

The *fmt-ck* structure can be illustrated as in Fig. 33.

Address Offset (Hex)	Code (Hex)	Meaning		
+00	66	"fmt" (ckID)		
+01	6D			
+02	74			
+03	20			
+04		ckSize (4 Bytes)		
+08		wformatTag (2 Bytes)	WAVEFORMATEX Structure (18 Bytes)	ckData[ckSize] of fmt-ck
+0A		nChannels (2 Bytes)		
+0C		nSamplesPerSec (4 Bytes)		
+10		nAvgBytesPerSec (4 Bytes)		
+14		nBlockAlign (2 Bytes)		
+16		wBitsPerSample (2 Bytes)		
+18		cbsize (2 Bytes)		
+1A		extByte[cbSize]	Additional Byte Arrays	
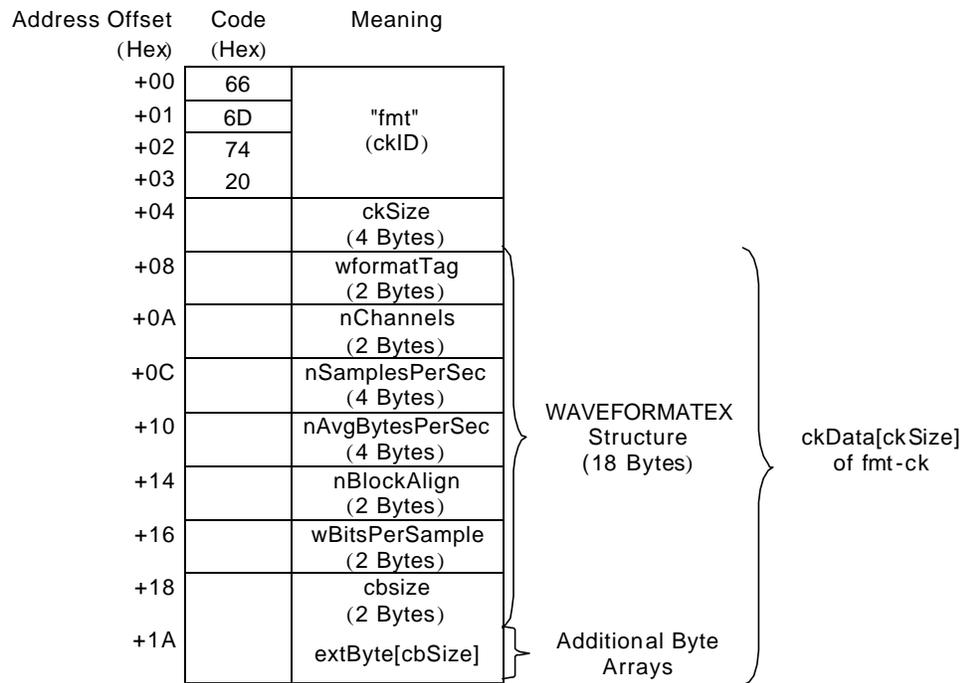

Fig. 33   fmt-ck Structure

\<fact-ck\>

fact-ck (fact chunk) is used to store file-dependent information relating to the *WAVE* file contents. The *ckID* (chunk ID) of *fact-ck* is "fact".

It is assumed that *fact-ck* will be extended in the future to store information needed by *WAVE* files at that time, but currently only one information member is defined.

The information that can be stored in *fact-ck* at the present time is defined in [Equation 4].

  unsigned long   dwSampleLength;   // Sample length - - - [Equation 4]

Table 24 fact-ck Member

Member	Description
dwSampleLength	An unsigned 32-bit integer indicating the number of audio data samples (sample length). When this information is combined with nSamplePerSec in fmt-ck, the data length can be expressed in seconds (recording time).

Since the only information defined presently is dwSampleLength, the value of *ckSize* (chunk Size) for *fact-ck* is '00000004.H'; but *ckSize* may change in the future as information is added (in which case it will be larger than '00000004.H'). Programs must be able to skip over fields they cannot Interoperability and go on to process the next chunk. For this reason the capability of correctly reading the value of *ckSize* is a necessary requirement.

The structure of *fact-ck* is illustrated in Fig. 34. The value of *ckSize* is fixed at '00000004.H' (this value is used in Write processing).
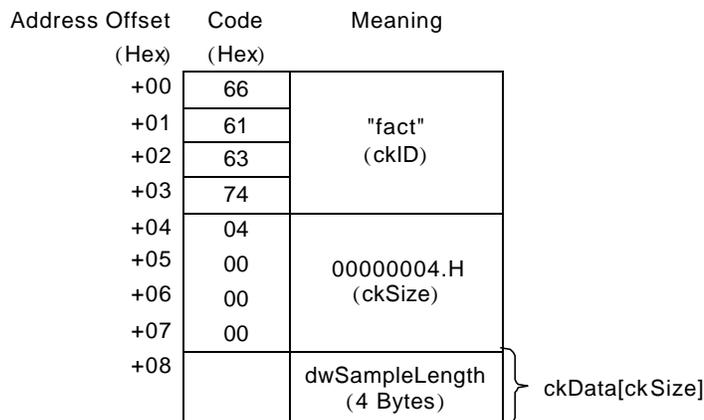

Fig. 34 fact-ck Structure

\<data-ck\>

data-ck (data chunk) is a chunk for storing audio data. Its *ckID* (chunk ID) is "data".

The *ckData* (chunk Data) of *data-ck* consists of the audio data only. In some cases the chunk is filled out with padding bytes.

The audio data is coded based on the format type. The information in *fmt-ck* is used when the audio data is played back.

The *ckSize* (chunk Size) of *data-ck* is the size of the coded audio data only. The structure of *data-ck* is illustrated in Fig. 35.
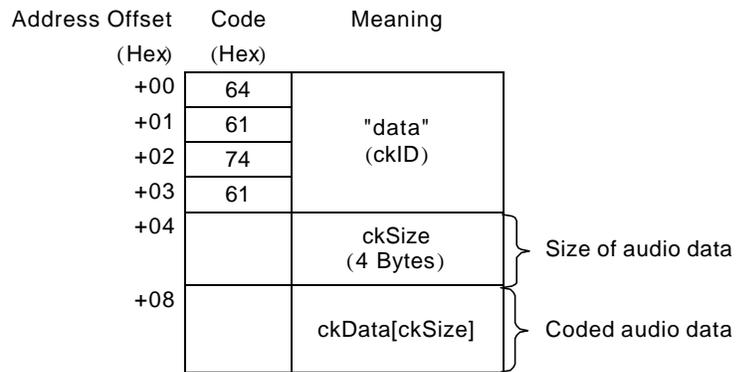

Fig. 35 data-ck Structure

3.5.2. Basic Structure of PCM Audio Data

PCM audio data has linear quantization (A/D conversion) characteristics, and is not encoded for compression. It therefore does not need to be decompressed for playback, but can simply be played by reading it directly.

The basic structure of audio data when the format type is PCM (Pulse Code Modulation) format is shown in Fig. 36.

Address Offset (Hex)	Code (Hex)	Meaning	
+00	52	"RIFF" (ckID)	
+01	49		
+02	46		
+03	46		
+04		ckSize (4 Bytes)	
+08	57	"WAVE" (formType)	
+09	41		
+0A	56		
+0B	45		
+0C		fmt-ck (24 Bytes)	PCM format information (size is 24 bytes fixed)
+24		data-ck	PCM format audio data

Fig. 36 Basic Structure of PCM Format

The specific values stored in *fmt-ck* in the case of PCM format are as shown in Table 25.

Table 25 PCM Format fmt-ck Information

PCM（Pulse Code Modulation) Format	
Members	Code
ckSize（fmt-ck)	00000010.H (16 Bytes, since cbSize is unnecessary)
wFormatTag	0001.H (PCM format)
nChannels	The values of each mode are as follows. 0001.H (monaural) or 0002.H (stereo)

nSamplesPerSec	The values of each mode are as follows.
	  00001F40.H (8.0 kHz)
	  00002B11.H (11.025 kHz)
	  00005622.H (22.05 kHz)
	  0000AC44.H (44.10 kHz)

nAvgBytesPerSec	The values of each mode are as follows.
	  00001F40.H (8.0 kHz, 8-bit monaural)
	  00003E80.H (8.0 kHz, 8-bit stereo)
	  00003E80.H (8.0 kHz, 16-bit monaural)
	  00007D00.H (8.0 kHz, 16-bit stereo)
	  00002B11.H (11.025 kHz, 8-bit monaural)
	  00005622.H (11.025 kHz, 8-bit stereo)
	  00005622.H (11.025 kHz, 16-bit monaural)
	  0000AC44.H (11.025 kHz, 16-bit stereo)
	  00005622.H (22.05 kHz, 8-bit monaural)
	  0000AC44.H (22.05 kHz, 8-bit stereo)
	  0000AC44.H (22.05 kHz, 16-bit monaural)
	  00015888.H (22.05 kHz, 16-bit stereo)
	  0000AC44.H (44.10 kHz, 8-bit monaural)
	  00015888.H (44.10 kHz, 8-bit stereo)
	  00015888.H (44.10 kHz, 16-bit monaural)
	  0002B110.H (44.10 kHz, 16-bit stereo)
	Definition: nSamplesPerSec * nBlockAlign

nBlockAlign	The values of each mode are as follows.
	  0001.H (8-bit monaural)
	  0002.H (8-bit stereo)
	  0002.H (16-bit monaural)
	  0004.H (16-bit stereo)
	Definition: nChannels * wBitsPerSample/8

wBitsPerSample	The values of each mode are as follows. 0008.H (8bit) or 0010.H (16bit)
cbSize	Not used
extByte[cbSize]	Not used

In the case of PCM format audio data, the data format of each sample is 8-bit or 16-bit integer. These sample data formats and their values are given in Table 26.

Table 26　Sample Data Formats and Values

Sample Size	Data Format	Minimum	Interoperability	Maximum
8-bit PCM	Unsigned Integer	0 (00.H)	128 (80.H)	255 (FF.H)
16-bit PCM	Signed Integer	-32768 (8000.H)	0 (0000.H)	32767 (7FFF.H)

The PCM format audio data contained in *data-ck* is packed as shown in Fig. 37. Here the left-hand byte stores the lower address and the right-hand byte holds the upper address.

8-bit monaural PCM

Fig. 37 Packing of PCM Audio Data

3.5.3. Basic Structure of μ-Law Audio Data

Each of the audio data samples of μ-Law audio data has nonlinear (logarithmic) quantization characteristics. For this reason 16 bits of data can be represented in an 8-bit size. In playback, either the data is first converted to linear 16-bit data and then put through a linear D/A converter, or else the analog signal is derived by going through an 8-bit nonlinear D/A converter with characteristics opposite the μ-Law quantization characteristics. Details of the nonlinear quantization characteristics and of the conversion between 8-bit μ-Law data and 16-bit linear data are given in the ITU-T G.711 [viii] standard.

When the format type is μ-Law (ITU-T G.711) format, the basic structure is expressed as in Fig. 38.

The two differences from PCM format are the larger size of *fmt-ck* (the cbSize file exists) and the existence of *fact-ck*.

Address Offset (Hex)	Code (Hex)	Meaning	
+00	52	"RIFF" (ckID)	
+01	49		
+02	46		
+03	46		
+04		ckSize (4 Bytes)	
+08	57	"WAVE" (formType)	
+09	41		
+0A	56		
+0B	45		
+0C		fmt-ck (26 Bytes)	μ-Law format information (size is 26 bytes fixed)
+26		fact-ck (12 Bytes)	Samples per channel-unit block (μ-Law format)
+32		data-ck	PCM format audio data

Fig. 38 Basic Structure of μ-Law Format

The specific values of the information stored in *fmt-ck* and *fact-ck* in the case of the μ-Law format are given in Table 27.

Table 27 fmt-ck and fact-ck Information in μ-Law Format

μ-Law (ITU-T G.711) Format	
Members	Code
ckSize(fmt-ck)	00000012.H (18 bytes, WAVEFORMATEX only)
wFormatTag	0007.H (μ-Law format)
nChannels	The values of each mode are as follows. 0001.H (monaural) or 0002.H (stereo)
nSamplesPerSec	00001F40.H (8.0kHz)

nAvgBytesPerSec	The values of each mode are as follows.
	    00001F40.H (8.0kHz, 8-bit monaural)
	    00003E80.H (8.0kHz, 8-bit stereo)
	Definition: nSamplesPerSec * nBlockAlign

nBlockAlign	The values of each mode are as follows.
	    0001.H (8bit monaural)
	    0002.H (8bit stereo)
	Definition: nChannels * wBitsPerSample/8

wBitsPerSample	0008.H (8bit)
cbSize	0000.H (extByte[cbSize] does not exist)
extByte[cbSize]	Not used
dwSampleLength	It is recommended that the actual number of samples that can be played be recorded here. Definition: (ckSize_of_data-ck) / nBlockAlign

The μ-Law audio data contained in *data-ck* is packed as shown in Fig. 39. Here the left-hand byte stores the lower address and the right-hand byte holds the upper address.

μ-Law monaural

Sample 0	Sample 1	Sample 2	Sample 3
Channel 0	Channel 0	Channel 0	Channel 0
Byte 0	Byte 1	Byte 2	Byte 3

μ-Law stereo

Sample 0		Sample 1	
Channel 0 (left)	Channel 1 (right)	Channel 0 (left)	Channel 1 (right)
Byte 0	Byte 1	Byte 2	Byte 3
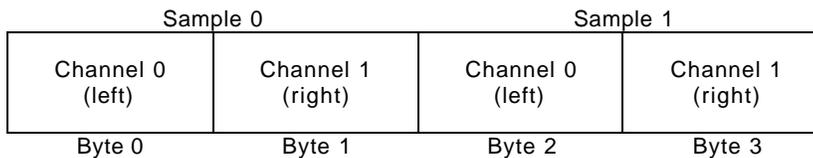

Fig. 39 Packing of μ-Law Audio Data

3.5.4. Basic Structure of IMA-ADPCM Audio Data

IMA-ADPCM audio data is 4 bit data obtained by compressing 16-bit linear PCM audio data. IMA-ADPCM, as seen in its other name DVI-ADPCM, uses a compression algorithm originally developed by the Intel DVI Group (DVI: Digital Video Interoperability). It was later adopted by the IMA (Interoperability Multimedia Association) as a standard audio data format.

Details of the IMA-ADPCM algorithm are given in the IMA Digital Audio Doc-Pac[xvii] and other documents.

When the format type is IMA-ADPCM (DVI-ADPCM), the basic structure is as shown in Fig. 40.

A *fact-ck* is recorded as with the μ-Law format, but a difference from that format is the larger *fmt-ck* size (in addition to a cbSize field there is a wSamplesPerBlock field).

| Address Offset (Hex)	Code (Hex)	Meaning	
+00	52	"RIFF" (ckID)	
+01	49		
+02	46		
+03	46		
+04		ckSize (4 Bytes)	
+08	57	"WAVE" (formType)	
+09	41		
+0A	56		
+0B	45		
+0C		fmt-ck (28 Bytes)	IMA-ADPCM format information (size is 28 bytes fixed)
+28		fact-ck (12 Bytes)	Samples per channel-unit block (IMA-ADPCM format)
+34		data-ck	PCM format audio data

Fig. 40 Basic Structure of IMA-ADPCM Format

The specific values of the information stored in *fmt-ck* and *fact-ck* in the case of the IMA-ADPCM format are given in Table 28 and Table 29.

Table 28 IMA-ADPCM Format fmt-ck and fact-ck Information (1)

IMA-ADPCM (DVI-ADPCM) Format	
Members	Code
ckSize(fmt-ck)	00000014.H (20 bytes)
wFormatTag	0011.H (IMA-ADPCM format)
nChannels	0001.H (monaural) or 0002.H (stereo)

nSamplesPerSec	The values of each mode are as follows.
	  00001F40.H (8.0 kHz)
	  00002B11.H (11.025 Hz)
	  00005622.H (22.050 Hz)
	  0000AC44.H (44.10 Hz)

nAvgBytesPerSec	The values of each mode are as follows.
	  00000FD7.H (8.0 kHz, 4-bit monaural)
	  00001FAE.H (8.0 kHz, 4-bit stereo)
	  000015D4.H (11.025 kHz, 4-bit monaural)
	  00002BA9.H (11.025 kHz, 4-bit stereo)
	  00002B5C.H (22.05 kHz, 4-bit monaural)
	  000056B9.H (22.05 kHz, 4-bit stereo)
	  0000566D.H (44.10 kHz, 4-bit monaural)
	  0000ACDB.H (44.10 kHz, 4-bit stereo)
	Definition: nSamplesPerSec*nBlockAlign/wSamplesPerBlock

nBlockAlign	The values of each mode are as follows.
	  0100.H (8.0 kHz, 4-bit monaural)
	  0200.H (8.0 kHz, 4-bit stereo)
	  0100.H (11.025 kHz, 4-bit monaural)
	  0200.H (11.025 kHz, 4-bit stereo)
	  0200.H (22.05 kHz, 4-bit monaural)
	  0400.H (22.05 kHz, 4-bit stereo)
	  0400.H (44.10 kHz, 4-bit monaural)
	  0800.H (44.10 kHz, 4-bit stereo)
	Although the definition is (N+1) * 4 * nChannels, the use of
	  256 * nChannels * max (1,nSamplesPerSec / 11.025kHz)
	is recommended.

wBitsPerSample	0004.H (4 bits)
cbSize	0002.H

Table 29 IMA-ADPCM Format fmt-ck and fact-ck Information (2)

IMA-ADPCM (DVI-ADPCM) Format	
extByte[cbSize]	The values of each mode are as follows. 　01F9.H (8.0 kHz, 4-bit monaural) 　01F9.H (8.0 kHz, 4-bit stereo) 　01F9.H (11.025 kHz, 4-bit monaural) 　01F9.H (11.025 kHz, 4 bit stereo) 　03F9.H (22.05 kHz, 4-bit monaural) 　03F9.H (22.05 kHz, 4-bit stereo) 　07F9.H (44.10 kHz, 4-bit monaural) 　07F9.H (44.10 kHz, 4-bit stereo) If the definition is, wSamplesPerBlock (an unsigned 16-bit integer indicating the samples per channel-unit block), and 　$X = (nBlockAlign - (4 * nChannels)) * 8$ 　$Y = wBitsPerSample * nChannels$ then, 　$wSamplesPerBlock = (X/Y) + 1$
dwSampleLength	It is recommended that the actual number of samples that can be played back be recorded. The definition is as follows. 　If $X = ckSize\_of\_data\text{-}ck / nBlockAlign$ then, 　$dwSampleLength = (X+1) * wSamplesPerBlock$

The IMA-ADPCM audio data contained in *data-ck* is packed as shown in Fig. 41, Fig. 42, and Fig. 43 when it is recorded.

A feature of this format is the existence of a header at the start of each block. The header records the initial sample value for that block and a step (quantization table) index. The audio data in each channel is independent, so the number of header words is the same as the number of channels.

A header word consists of 4 bytes, and is defined as in [equation 5]. The existence of a header means IMA-ADPCM audio data can be played from any block. In other words, random access is possible on a per-block basis.

In Fig. 41 to Fig. 43, the left-hand byte stores the lower address and the right-hand byte holds the upper address.

```
    typedef struct {

            signed int   iSamp0;              // Initial sample value of the block

            unsigned char   bStepTableIndex;  // Step table index

            unsigned char   bReserved;        // reserved byte

} IMA_ADPCMBLOCKHEADER;                                    - - -[Equation 5]
```

In Fig. 41 to Fig. 43, N, M, and P have the following significance.

$N = (nBlockAlign/(4*nChannels)) - 1$ - - -[Equation 6]

$M = 0, 1, 2, 3, ... , N-1$ - - -[Equation 7]

$P = (M * 8) + 1$ - - -[Equation 8]

Header		Data		
Header Word Channel 0 (left)	Header Word Channel 1 (right)	Data Word 0 Channel 0 (left)	Data Word 0 Channel 1 (right)	....

Data (total = N words/Channel)

3.6. Chunks Used

The chunks used in Exif audio files are described here.

3.6.1. WAVE Form Audio File Basic Chunks

The basic chunks of a WAVE Form Audio File, as is evident from the basic structure of the *WAVE* file shown in Fig. 32, are the four below.

- RIFF chunk

- fmt chunk

- fact chunk

- data chunk

[Additional Explanation]

- The fmt chunk, fact chunk and data chunk are sub-chunks of the *RIFF* chunk. A *WAVE* file consists of one *RIFF* chunk, with specific information recorded in the sub-chunks.

- Only when the form type is PCM (Pulse Code Modulation) format, the fact chunk is unnecessary. With non-PCM formats such as μ-Law and IMA-ADPCM, it is mandatory, which is why *fact-ck* is included in the basic chunks here.

- It is possible to add other optional sub-chunks as well.

- At the head of the chunk data (*ckData*) of the *RIFF* chunk there is a form type called "*WAVE*".

3.6.2. LIST Chunk and INFO List

A *WAVE* form and other *RIFF* forms store a variety of information in sub-chunks of the *RIFF* chunk. These sub-chunks in many cases are specific to each form type; but there are also general-purpose chunks for storing additional information regardless of the data specified for a given form type.

One of these general-purpose chunks is the *LIST* chunk. Here the use of the *LIST* chunk is explained.

(1) LIST Chunk

The *LIST* chunk is a general-purpose chunk that can be used with the files of many different form types. The *LIST* chunk is a pre-registered general-purpose chunk, so its *ckID* (chunk ID) is written in upper-case letters.

Included in the *LIST* chunk is a sub-chunk list (series of sub-chunks) and sequence designation.

The *LIST* chunk *ckData* (chunk data) consists of a four-character code at the beginning called a listType (list type), followed by the sub-chunk list.

This structure resembles that of the *RIFF* chunk, but the *LIST* chunk is always farther down the hierarchy than the *RIFF* chunk.

The list type is used to identify the list contents. For this reason there are list types that are used only with certain form types. If a list type is encountered that cannot be Interoperability, that *LIST* chunk can be ignored.

The list type must be registered. A general-purpose list type that is registered and can be used with various form types is written in all upper-case letters.

A list type that can be used only with a specific form type is written in lower-case letters.

The *LIST* chunk structure is illustrated in Fig. 44.

Address Offset (Hex)	Code (Hex)	Meaning
+00	4C	"LIST" (ckID)
+01	49	
+02	53	
+03	54	
+04		ckSize (4 Bytes)
+08		listType (4 Bytes)
+0C		Subchunk1
⋮		Subchunk2
⋮		⋮

Sub-chunk list

ckData [ckSize] of LIST chunk
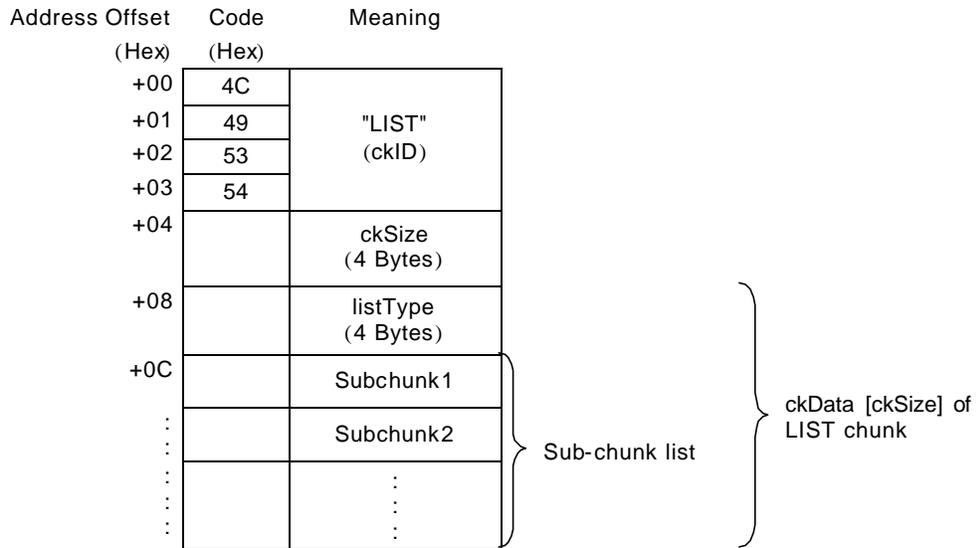

Fig. 44 LIST Chunk Structure

(2) INFO List

An "*INFO list*" is a *LIST* chunk having the registered, general-purpose listType "*INFO*".

The need for information such as title, copyright and comments is similar in each of the form types. The *INFO list* is used for storing these kinds of information.

The information itself in an *INFO list* is stored in the sub-chunk lists. These sub-chunks use only pre-registered, general-purpose chunks, described later below.

The *INFO list* information is supplementary and has no influence on the Interoperability of the main data, such as WAVE form audio data. It can therefore be skipped without problem. If an unknown chunk is included on the *INFO list*, as when a new chunk has been defined, it is to be ignored.

The *INFO list* chunks currently defined are given in Table 30. These pre-registered chunks are stored as ASCII text strings terminated by NULL (the final byte is '00.H').

Table 30 INFO List Chunks

Channel ID	Description
IARL	Archival Location. Indicates where the subject of the file is archived.
IART	Artist. Lists the artist of the original subject of the file.
ICMS	Commissioned. Lists the name of the person or organization that commissioned the subject of the file.
ICMT	Comments. Provides general comments about the file or the subject of the file.
ICOP	Copyright. Records the copyright information for the file.
ICRD	Creation date. Indicates the date the subject of the file was created.
ICRP	Cropped. Indicates whether an image has been cropped
IDIM	Dimensions. Specifies the size of the original subject of the file.
IDPI	Dots Per Inch. Stores the dots per inch (DPI) setting of the digitizer used to produce the file.
IENG	Engineer. Stores the name of the engineer who worked on the file.
IGNR	Genre. Describes the genre of the original work.
IKEY	Keywords. Provides a list of keywords that refer to the file or subject of the file.
ILGT	Lightness. Describes the changes in lightness settings on the digitizer required to produce the file.
IMED	Medium. Describes the original subject of the file, such as, "computer image," "drawing," "lithograph," and so forth.
INAM	Name. Stores the title of the subject of the file.
IPLT	Palette Setting. Specifies the number of colors requested when digitizing an image.
IPRD	Product. Specifies the name of the title the file was originally intended for, such as "Encyclopedia of Pacific Northwest Geography."
ISBJ	Subject. Describes the file contents, such as "Aerial view of Seattle."
ISFT	Software. Identifies the name of the software package used to create the file.
ISHP	Sharpness. Identifies the changes in sharpness for the digitizer required to produce the file.
ISRC	Source. Identifies the name of the person or organization who supplied the original subject of the file.
ISRF	Source Form. Identifies the original form of the material that was digitized, such as "slide," "paper," "map," and so forth.
ITCH	Technician. Identifies the technician who digitized the subject file.

A typical *INFO list* is shown in Fig. 45.

Fig. 45 Typical INFO List

The following points need to be observed in using the *INFO list*. They are explained in reference to Fig. 45.

- The 'Z' at the end of the text string information in the *INAM* and *ICMT* chunks means NULL termination. The actual code appended is '00.H'.

- The chunk data (*ckData*) in each chunk must be an even number of bytes. If the data itself is an odd number of bytes, it must be padded by one additional byte.

- In the example in Fig. 45, the *ICMT* chunk has 33 bytes of information including the NULL termination, so a padding byte '00.H' must be appended. No padding is necessary with the *INAM* chunk information, since the size including NULL termination is 10 bytes.

- The value of the chunk size (*ckSize*) of the *ICMT* chunk does not include the padding byte. However, the chunk size of the *LIST* chunk that is its parent chunk must include the padding bytes in the sub-chunks. If this

rule is not observed, it will not be possible to determine the start address of a chunk following after this *LIST* chunk.

(3) INFO List used by Exif audio files

The *INFO list* used with Exif audio files is as follows.

The chunks that can be included on the *INFO list* are those given in Table 30; but of these, only the following are used with Exif audio files.

[Chunks Used with Exif]

INAM

Records the title of the Exif audio file. The title is written in an ASCII string and terminated with NULL. Recording this information is optional.

Ex.)　"Exif Audio File Example"Z

IGNR

Records the genre of the Exif audio file subject. The genre name is written in an ASCII string and terminated with NULL. Recording this information is optional.

Ex.)　"narration"Z

ICRD

Records the date the Exif audio file was created. It is written as a fixed-length ASCII string, in the format year-month-day. That is, the year, month, and day are separated by a hyphen. The year is four digits, while month and day are two digits each. If the number of the month or the day is less than 10, the first digit is 0. The order must be year-month-day. Since this information is written as an ASCII string, it must be terminated with NULL. This chunk is fixed-length (the chunk data is 11 bytes, and a padding byte is added to make it an even byte number). Recording this information is optional.

Ex.)　"1997-04-08"Z　(Note: =April 8, 1997)

ICMT

Records a general comment on the Exif audio file or its subject. Comments are written in ASCII text terminated with NULL. If there are two or more comments, each statement ends with a period. A carriage return or line feed character must not be used. Recording this information is optional.

Ex.)　"Recorded by Digital Still Camera"Z

IART

Records the name of the Exif audio file creator. The name is written in an ASCII string and terminated with NULL.

Recording this information is optional.

    Ex.)   "Taro Yamada"Z

ICOP

Records copyright information for the Exif audio file. The copyright is written in ASCII text and terminated with NULL. In case of multiple copyright information, each is separated by a semicolon followed by one blank space (20.H). Recording this information is optional.

    Ex.)   "Copyright Exif Corporation 1997."Z

[Notes and Additional Information]

- A camera shall not record chunks other than those listed above.

- If a camera encounters an unknown chunk when reading the *INFO list*, it shall skip that chunk. It is possible that the *INFO list* will be expanded in the future, and this provision ensures that compatibility will be maintained.

- Information shall be recorded in accord with the general *INFO list* stipulations.

- All the information on the *INFO list* is optional, and does not have to be recorded.

- The *INFO list* used for Exif audio files consists of pre-registered, general-purpose chunks only, which means this information can be read by commercial "RIFF Form Reader" software (such as the utility software provided with Windows™).

3.6.3. Chunks for Attribute Information Specific to Exif Audio Files

Recording of attribute information specific to Exif audio files is done as follows.

Exif-specific attributes are those not defined for ordinary WAVE Form Audio Files but only for Exif audio files. This is auxiliary information with no influence on Interoperability of the audio data itself. For this reason an Exif audio file can still be compatible with a standard WAVE Form Audio File.

The attributes specific to Exif audio files are recorded as follows.

(1) LIST chunk is used.

The compatibility noted above is realized by using a pre-registered, general-purpose *LIST* chunk to record the attribute information specific to Exif audio files. Since it can be used with all the *LIST* chunk form types, this chunk can be put in the WAVE Form Audio File. The individual information is recorded in sub-chunks of the *LIST* chunk.

(2) A dedicated list type "exif" is defined.

The information in the *LIST* chunk is explicitly labeled as information specific to Exif audio files by defining a dedicated list type. The following is used as this list type.

- Dedicated Exif list type: "exif" (all lower-case letters)

The attributes specific to Exif audio files cannot be used in the WAVE Form Audio File format, so it is all written in lower-case letters.

Hereafter, the notation "exif list" is used to mean the *LIST* chunk whose list type is exif.

(3) A dedicated chunk is defined for each of the attributes.

Since there are no corresponding existing chunks, a dedicated chunk is defined to record the attribute information specific to Exif audio files. The information items and their chunks are described below.

[Information items and chunks]

ever

Records the version information (number) of this standard.

As with Exif image files, it is recorded in 4 bytes. The address bytes are recorded as A1, A2, B1, B2, starting with the lowest number. A1 and A2 store the upper part of the standard version, with the lower part stored in B1 and B2. A1, A2, B1 and B2 are ASCII numerals giving the version number, but NULL termination is unnecessary. This chunk is mandatory.

On the conventions for version number updating, see section 3.2.

    Ex.)   "0200"   (Note: =Version 2.00)

erel

Records information pointing to an Exif image file related to the Exif audio file recorded in this chunk. Recording this information makes it possible for a camera or application software to map an image to sound during playback.

The relational information consists of the name of the corresponding Exif image file, given as an 8-character file name plus 3-character extension in ASCII format. The path is not written. Stipulations on images are given in section 2.6.5. File naming rules are covered in section 3.7.1.

The mapping of Exif image files and audio files is done in any of the three ways shown in Table 31. If multiple files are mapped to one file as in [2] or [3] of Table 31, the above format is used to record just one destination file name. If there are multiple destination files, the first recorded file is given.

In the case of [2] in Table 31, for the Exif audio file "SND00001.WAV" only "DSC00001.JPG" is given as the related image file. When there are three Exif image files "DSC00001.JPG," "DSC00002.JPG" and "DSC00003.JPG," the related Exif audio file name for each of them, "SND00001.WAV," is indicated. By combining multiple relational information, a variety of playback possibilities can be supported. The method of using relational information is left to the implementation on the playback side. Since this information is an ASCII character string, it is terminated by NULL. If there is a related Exif image file, this chunk is mandatory.

    Ex.)   "DSC00001.JPG"Z

Table 31 Mapping between Image and Audio Files

	Relationship	Exif Image File	Exif Audio File
[1]	1 to 1	DSC00001.JPG ← →	SND00001.WAV
[2]	Many to 1	DSC00001.JPG DSC00002.JPG DSC00003.JPG	SND00001.WAV
[3]	1 to many	DSC00001.JPG	SND00001.WAV SND00002.WAV SND00003.WAV

etim

Records the time of Exif audio file creation. This is defined as the time the recording of audio data was started. Time is expressed as a variable-length ASCII string. In order to conform as closely as possible to the Exif image file, time is recorded in the format "hour:minute:second.subsecond," with a colon in between each time unit and a period before the subsecond position.

Hour, minute and second are written as two digits each, with the first digit a zero if the value is one digit. Subseconds can be expressed to any desired decimal place. If there is no subsecond information, the string ends with a period only.

The order of time units is hour, minute, second, subsecond. The information is written as an ASCII string, so it must be terminated with NULL. Recording this information is optional.

    Ex.)   "10:05:10.130"Z

ecor

Records the name of the manufacturer of the equipment on which the Exif audio file was created. The manufacturer name is written in an ASCII string and terminated with NULL. Recording this information is optional.

    Ex.)   "Digital Still Camera Corporation"Z

emdl

Records the model name of the equipment on which the Exif audio file was created. The model name is written in an ASCII string and terminated with NULL. Recording this information is optional.

    Ex.)   "DSCamera1000"Z

emnt

As with Exif image files, this chunk is used by the writer manufacturer to record design information, version history and other maker-specific information. The contents and format of the information are up to each manufacturer.

Other manufacturers see this information only as a byte array of the size determined by the chunk size (*ckSize*).

Recording this information is optional.

eucm

Records user comment information that cannot be recorded on, or is not suitable for, the *INFO list*. Basically this is text information. Character code information is included so languages that do not use ASCII can be used here. Recording this chunk is optional.

Recording of user comments is discussed below. The structure of the user comment chunk is shown in Fig. 46.
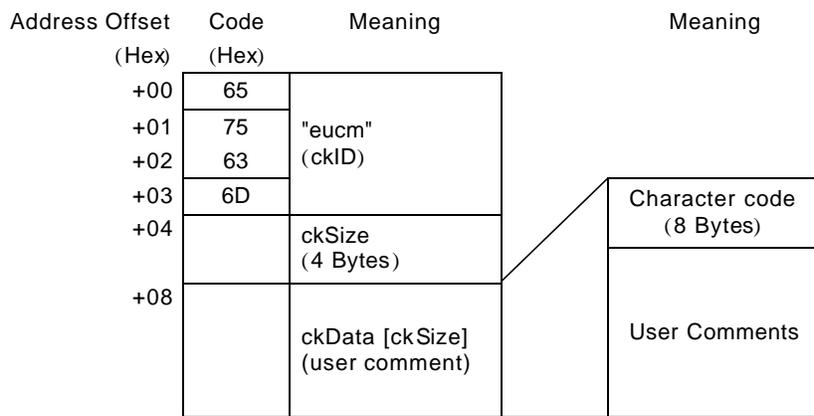

Fig. 46 Structure of User Comment Chunk

As seen in Fig. 46, the chunk data area storing the user comment starts with an 8-byte character code area, where the character code is given. The rest of the chunk data area is the user comment area, used for writing comments. The currently defined character codes are shown in Table 32. A registration system is used for character codes to avoid duplication. When a character code is registered, a standard document is indicated in the reference column to indicate the character format specification. If a character code is used for which there is no clear specification like Shift-JIS in Japan, Undefined is designated.

The character code is written from the start of the character code area, and the unused portion is padded with NULL ('00.H'). In order to match the format of the actual comments in the user comment part to that of the Exif image file *UserComment* tag, NULL termination is not used even if the comment is written in ASCII text. In accord with the chunk specification, however, a padding byte ('00.H') is used if the chunk data is not an even number of bytes.

Table 32 Character Codes and Character Code Designation

Character Code	Code Designation (8 Bytes)	Reference
ASCII	41.H, 53.H, 43.H, 49.H, 49.H, 00.H, 00.H, 00.H	ITU-T T.50 IA5[x]
JIS	4A.H, 49.H, 53.H, 00.H, 00.H, 00.H, 00.H, 00.H	JIS X0208-1990[xi]
Unicode	55.H, 4E.H, 49.H, 43.H, 4F.H, 44.H, 45.H, 00.H	Unicode Standard [xii]
Undefined	00.H, 00.H, 00.H, 00.H, 00.H, 00.H, 00.H, 00.H	Undefined

[Notes and Additional Information]

- The above chunks incorporated in exif list are used with a specific form type ('*WAVE*') and are therefore written in all lower-case letters.

- Only the *ever* chunk is mandatory; the others are optional. If an Exif image file related to an audio file exists, the *erel* chunk is also mandatory.

- When the exif list is read by a camera, information that cannot be recognized may be encountered, such as the *emnt* chunk or an Undefined string in the *eucm* chunk. In that case the chunk is to be skipped.

- An Exif reader and writer must conform to the stipulations for an ordinary *LIST* chunk.

- A general-purpose RIFF Form Reader will ignore the exif list. A dedicated Exif reader is required for reading the exif list.

- Fig. 47 shows the exif list structure and a coding example. The *ever* chunk is mandatory and has a fixed length (chunk data is 4 bytes). The *erel* chunk data is 13 bytes (odd), so a padding byte is added. The *erel* chunk is also fixed length.

3.7. Data Description

3.7.1. File Naming Stipulation

The file name and characters used for file names are not specified, other than to stipulate the use of ASCII alphanumerics. (File names in Japanese or other character sets are not to be used.) File names shall be 8 characters or fewer, not including the extension. (Long file names are not to be used.) The file extension is ".WAV" (to match the WAVE Form Audio File extension) regardless of the audio data format type.

Typical Exif Audio File Fig. 48 shows the configuration of a typical Exif audio file.

The shaded parts of Fig. 48 are the mandatory elements of an Exif audio file. The hatching (*fact-ck* only) means that this chunk is not required if the audio data is PCM (Pulse Code Modulation) format, but is mandatory for all non-PCM formats (μ-Law, IMA-ADPCM), etc. The non-shaded elements are optional.

RIFF Chunk

- data (Data Chunk)
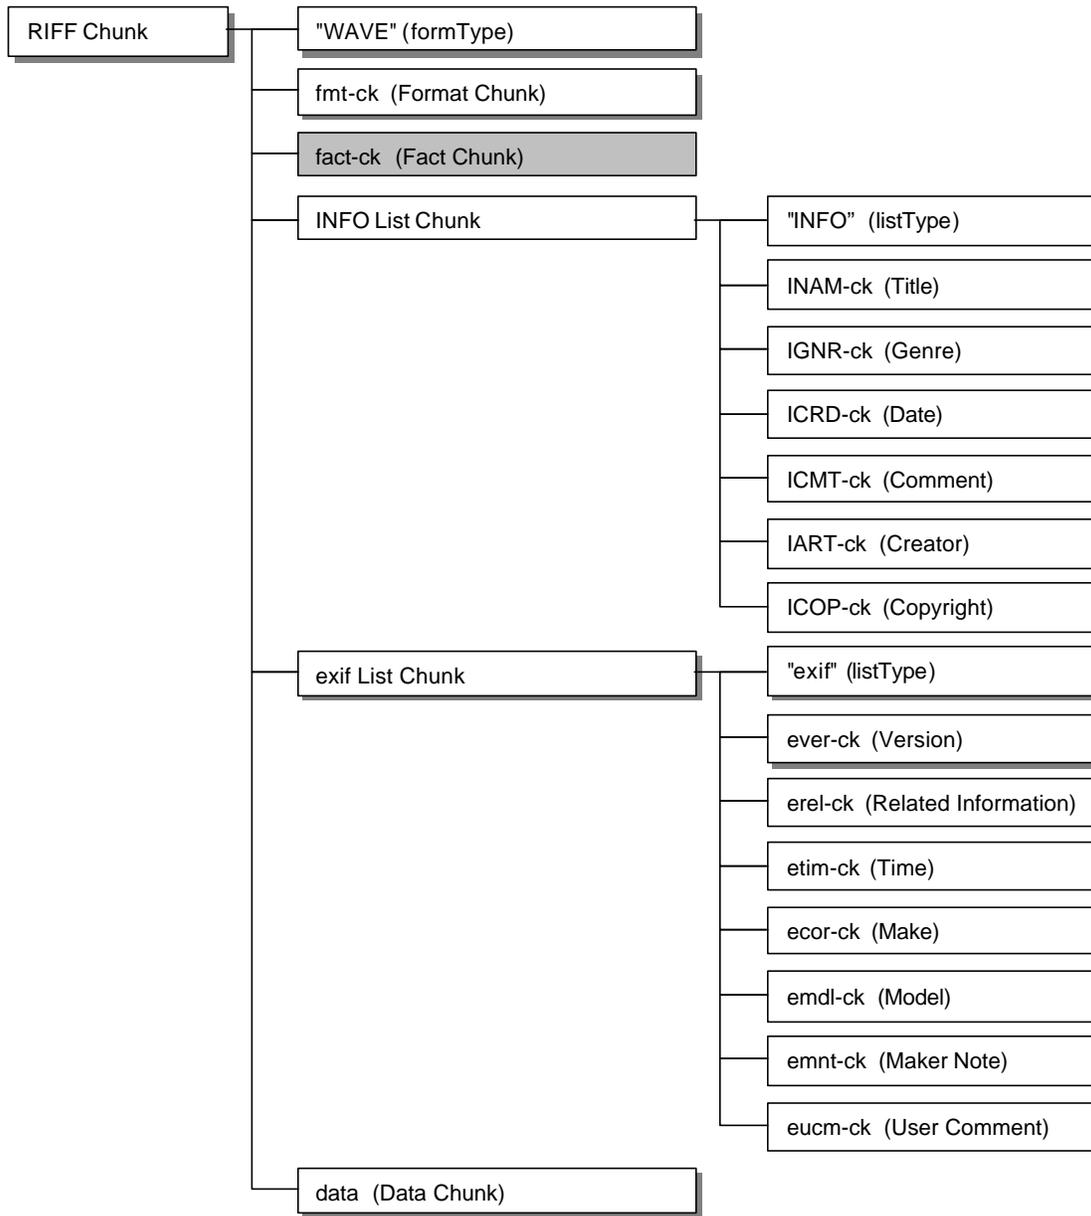

Fig. 48 Exif Audio File Configuration

The means of recording the data of each element is given in the section for that element.

Fig. 49 shows the most common Exif audio file data structure. Exif audio file data is recorded in accord with the structure shown in Fig. 49. Each sub-chunk is recorded in accord with its stipulations. Optional chunks may be omitted.

Appendix C   <u>APEX Units</u>

The camera information in this standard conforms to the APEX (Additive System of Photographic Exposure) unit system. APEX is a convenient unit for expressing exposure (Ev). The relation of APEX to other units is essentially as follows.

- ApertureValue (Av) = 2 log $_2$ (F number)

- ShutterSpeedValue (Tv) = - log $_2$ (exposure time)

- BrightnessValue (Bv) = $\log_2$ (B/NK) Note that: B:cd/cm^2, N,K: constant

Film sensitivity (not used in this standard) is expressed as follows.

- Film sensitivity (Sv) = $\log_2$ (ASA / 3.125)

Using these values, exposure (Ev) is calculated as follows.

- Ev = Av + Tv = Bv + Sv

The table below gives examples of values actually used as camera information.

Table 49 Typical APEX Values

ApertureValue (APEX)	F-Number
0	1
1	1.4
2	2
3	2.8
4	4
5	5.6
6	8

1	2
2	4
3	8
4	15
5	30

Appendix D   Recommended Implementation Examples

The purpose of this chapter is not to restrict Exif implementations, but to show examples of recommended practices that will increase the level of compatibility among DSC cameras and related systems using general-purpose removable media such as PC Card or Smart Media.

The practices illustrated below are recommended for DSC and other embedded systems when the processing capacity for handling the recording media is limited.

D.1   Recommended Directory Name Usage Examples

Writers

Create a subdirectory "IMxxxxxx" Interoperability the root directory, and record the Exif file there. The "xxxxxx" part of the name consists of no more than 6 alphanumerics and cannot contain special characters. "IM" are upper case. Hereafter this is called the Exif directory.

D.2   Recommended File Naming Usage Examples

Readers

An Exif reader plays the files in the Exif directory noted in D.1 above, treating those with the extension "JPG" as Exif compressed files, those with the extension "TIF" as Exif uncompressed files, and those with the extension "WAV" as audio files. On this basis it confirms the mandatory tags or chunk data in the file and plays it as appropriate. No specification is made regarding the handling of files with extensions other than the above.

D.3   Recommended File Operation Usage Examples

Exif compressed files, uncompressed files and audio fles can be recorded in the same Exif directory. It is also possible to create two or more Exif directories Interoperability the root directory, so long as the stipulations for "IMxxxxxx" (in D.1 above) are observed. A specific usage case is given below.

Usage case

If the recording medium already has an Exif directory (e.g., IMXYZ) recorded by a different model, separate from the self-recorded Exif directory (e.g., IMFIDX10), then a self-recorded Exif directory (IMFIDX10) can be created

Interoperability the root directory and used to record Exif files.

In this case the existing Exif directory (IMXYZ) continues to be preserved on the medium (see Fig. 50).
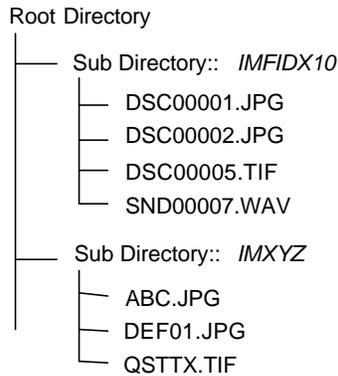

```
Root Directory
├── Sub Directory::  IMFIDX10
│       ├── DSC00001.JPG
│       ├── DSC00002.JPG
│       ├── DSC00005.TIF
│       └── SND00007.WAV
├── Sub Directory::  IMXYZ
        ├── ABC.JPG
        ├── DEF01.JPG
        └── QSTTX.TIF
```

Fig. 50   Directory Structure and File Recording Example

Readers

The reader recognizes an Exif directory "IMxxxxxx"in the root directory (a subdirectory with "IM" as the first two letters of its name) and files in it that meet the naming conventions in section 2.8.3 and section 3.7.1, and plays the file if the contents of the mandatory tags or chunks match the equipment specifications.

When there are multiple Exif directories "IMxxxxxx" Interoperability the root directory, it must be possible to recognize the files recorded in those directories.

D.4 Interoperability "Recommended Exif Interoperability Rules" (ExifR98)

ExifR98 is established as detailed rules recommended by this specification to ensure the more playback Interoperability among the devices using this specification. In ExifR98 naming rules of directories and files to store images are defined more concretely in conformance with this specification and the thumbnail format and covering range of playback is defined according to the function of devices.

Separate Volume   Recommended Exif Interoperability Rules Version 1.0

Appendix E   <u>Color Space Guidelines</u>

These guidelines are given with reference to sRGB[xviii], ITU-R BT.709[xix], and ITU-R BT.601[xx]. For details see the documents themselves.

E.1   sRGB

The sRGB standard gives strict color space definitions based on standard monitor characteristics and viewing conditions (details are Interoperability deliberation in IEC/TC 100 PT 61966). This standard takes the characteristics of typical commercially available displays as its median reference values.

ITU-R BT.709 is a standard specification for cameras, which specifies algorithms for photographing a scene and displaying it on a standard monitor. It does not, however, give a clear specification of the standard monitor characteristics. Accordingly, sRGB can be thought of as a standard that augments and is compatible with ITU-R BT.709.

In actual camera design, the ITU-R BT.709 characteristics can be used as the picture-taking algorithms, presupposing the standard monitor characteristics and viewing conditions given in sRGB, in order to generate images with a standard color space.

E.2   Tone Reproduction (Brightness and Contrast)

Scene reflectance can be nonlinearly converted based on ITU-R BT.709, and recorded using 8-bit quantization.

The ITU-R BT.709 transfer characteristics are as follows.

(1) When R, G, B equal or lager than 0.018

$R' = 1.099R^{0.45} - 0.099$

$G' = 1.099G^{0.45} - 0.099$

$B' = 1.099B^{0.45} - 0.099$

(2) When R, G, B less than 0.018

$R' = 4.5R$

$G' = 4.5G$

$B' = 4.5B$

After this conversion takes place, the data are enlarged by a factor of 255 and recorded using 8-bit quantization.

E.3 Luminance/Chrominance and RGB Transformation

Calculation of R, G, B from luminance Y and chrominance Cb and Cr takes place as follows based on ITU-R BT.601.

$$Y = 0.299R + 0.587G + 0.114B$$

$$Cb = (-0.299R - 0.587G + 0.886B) * 0.564 + offset$$

$$Cr = (0.701R - 0.587G - 0.114B) * 0.713 + offset$$

Appendix F   Notes on Conversion to FlashPix

The data recording method in this standard makes it possible to convert from Exif to FlashPix format with no loss of image quality, and retaining all attribute information. A file that is thus designed from the start for conversion to FlashPix is called a FlashPix-Ready (FPXR) file.

There are three main FlashPix-Ready functions:

- All Exif tag information is mapped to the FlashPix Image Info Property Set,
- APP2 extended data can be converted to FlashPix extensions,
- JPEG images can be converted to the FlashPix tile structure without image quality loss, making use of restart markers.

Fig. 51 illustrates the conversion process.
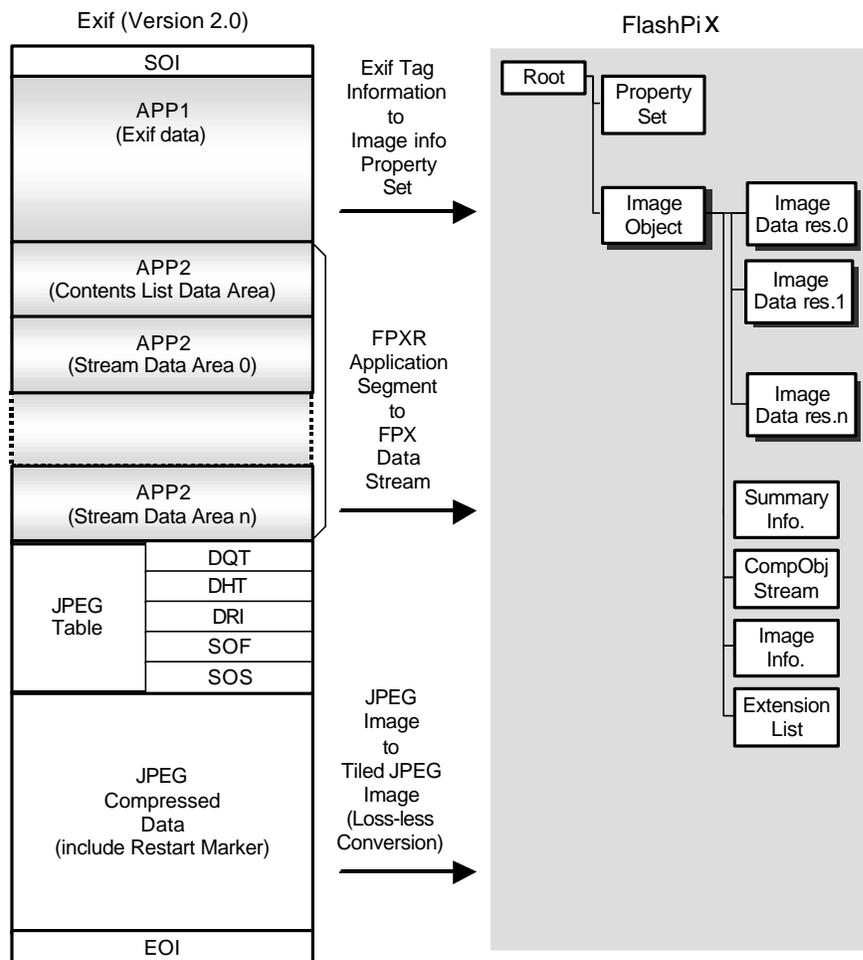

Fig. 51 Conversion from Exif to FlashPix

F.1   Converting Image Data

FlashPix compressed image data consists of JPEG-compressed 64 x 64-pixel tiles. Converting JPEG images without restart markers to FlashPix images requires that the JPEG data be expanded and re-compressed, which can lead to image quality loss. By inserting restart markers at 64-pixel Interoperability, FlashPix images of the maximum resolution can be generated simply by rearranging the JPEG-compressed data.
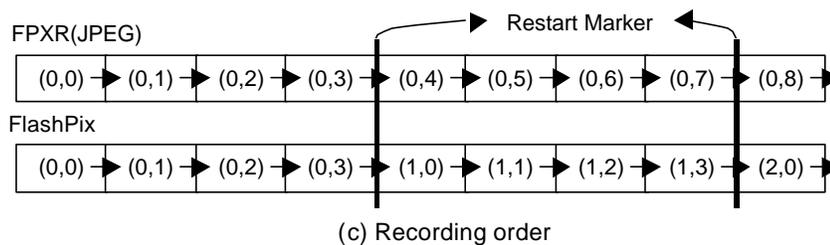

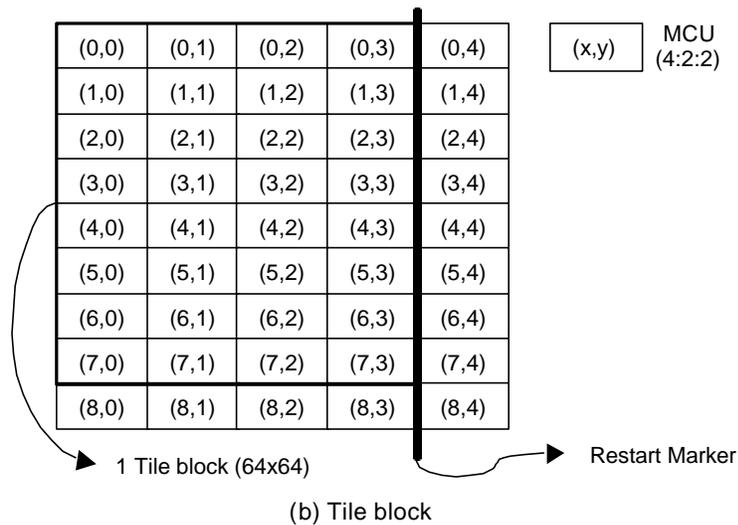

Fig. 52 shows how compressed data is rearranged using restart markers.

Fig. 52 Conversion to FlashPix Using Restart Markers

Recording of restart markers is optional, and conversion to FlashPix is possible without them; but conversion without restart markers may result in some image quality loss and require a longer processing time.

In order for restart markers to be inserted at 64-pixel Interoperability, the image data width must be an exact multiple of 64. Therefore the valid image width is recorded as tag information (*PixelXDimension*), and the JPEG compressed data is recorded with the valid image padded to the right to make it an exact multiple of 64 (see section 2.8.1).

As in the FlashPix standard, padding is used where necessary to achieve exact multiples of 64; and when converting to FlashPix, the padding data on the right can be treated in the same way as valid image data.

If the image height is not an exact multiple of 64, Exif files are not padded; so when converting to FlashPix it is necessary to pad the bottom edge of the image.

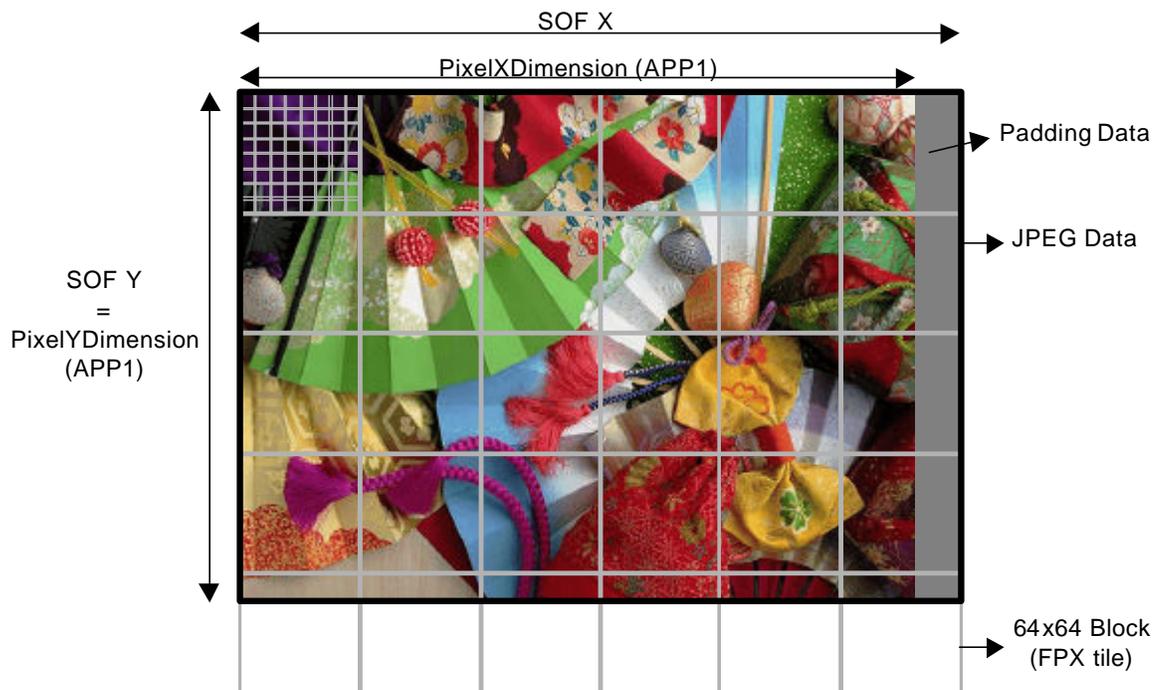

Fig. 53 Image Size Restrictions

F.2 Converting Tag Data

When Exif attribute information is converted to FlashPix, a one-to-one conversion can be made to the   Property Set used to record FlashPix attributes. The rules for converting from each kind of Exif tag to the FlashPix PropertySet are given in the tables below (conversion of GPS Info tags is to be determined later).

Table 50 Conversion between Exif Tags and FlashPix Property Set（1）（TIFF Tags）

F.3   Converting to FlashPix Extensions (APP2)

The extended data recorded in APP2 marker segments can be converted readily to FlashPix extensions.

First of all, Fig. 54 shows the conversion process when APP2 is recorded as one Interoperability per stream of data.

An area with data size of 8000.H, Default value 00.H is allocated to the stream name "/¥005MyPropertySet" (¥005 means 005.H) in the FlashPix file Structured Storage structure, and the stream data recorded in APP2-2 is copied to offset 00000000.H, that is, the start of the allocated area.
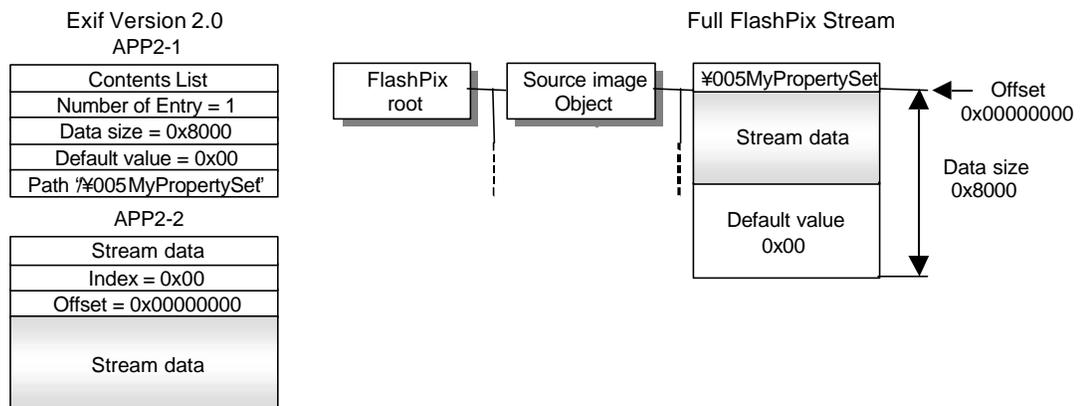

Fig. 54 Conversion to FlashPix Extensions（1）

Next, Fig. 55 shows the conversion process when one Interoperability per two streams of data is recorded in APP2.

This time an area with data size of 10000.H, Default value 00.H is allocated to the stream name "/¥005MyPropertySet" in the FlashPix file Structured Storage structure, and the stream data recorded in APP2-2 is copied to offset 00000000.H, that is, the start of the allocated area, while the stream data recorded in APP2-3 is copied starting from offset 00008000.H.

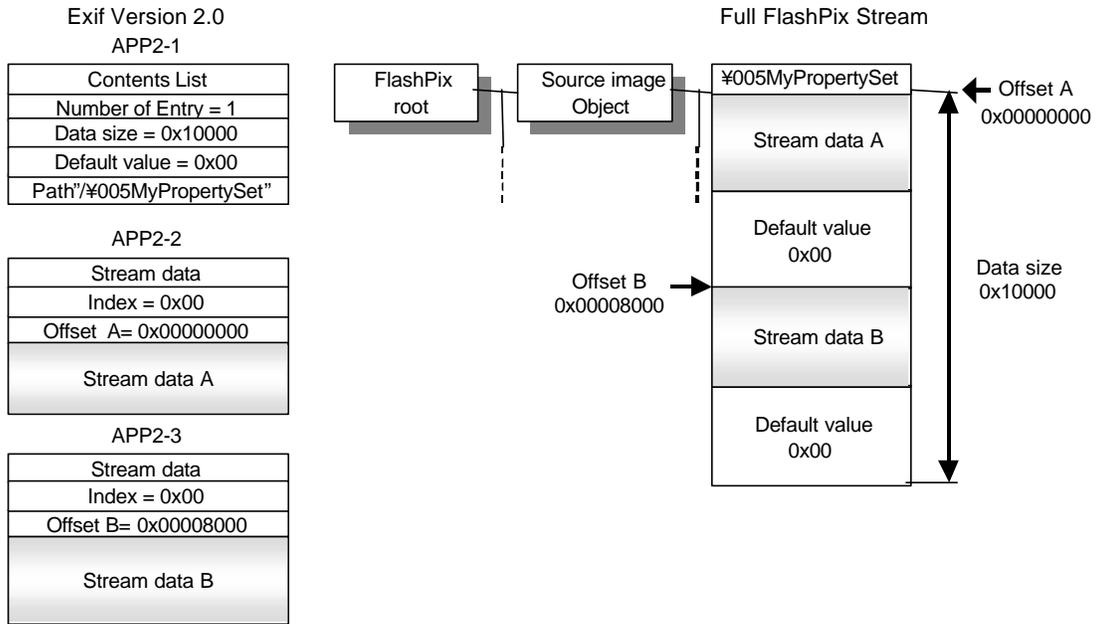

Fig. 55 Conversion to FlashPix Extensions (2)

Finally, Fig. 56 shows an example of conversion when 2 Interoperability per stream of data are recorded in APP2.

Here a data size of 8000.H, Default value 00.H is allocated to the stream name "MyPropertySet" Interoperability the storage name "¥005MyStorage" in the FlashPix file Structured Storage structure, and the stream data recorded in APP2-2 is copied to offset 00000000.H, that is, the start of the allocated area.
